Final

Remedial Investigation Report
Operable Unit No. 12 (Site 3)

Marine Corps Base,
Camp Lejeune, North Carolina

Appendices

Prepared For:

Department of the Navy
Atlantic Division
Naval Facilities
Engineering Command
Norfolk, Virginia

Under the

LANTDIV CLEAN Program

Comprehensive Long-Term
Environmental Action Navy

Reference:
Contract
N62470-89-D-4814

CTO-0274
12
July 1996

APPENDICES

A	Field Investigation Documentation
B	Sample Documentation
C	Well Development Records
D	IDW Summary
E	Aquifer Characterization Data
F	Base Background Soil Report
G	Baker's Evaluation of Metals in Groundwater Report
H	Data and Frequency Summaries
I	Field Duplicate Summaries
J	QA/QC Summaries
K	Engineering Parameter Data
L	COPC Worksheet
M	Statistical Summaries
N	CDI Calculations and Spreadsheets
O	Field Data Sheets
P	Endangered Species Survey
Q	Terrestrial Reference Values and CDI Spreadsheets

APPENDIX A
FIELD INVESTIGATION DOCUMENTATION

APPENDIX A.1
TEST BORING LOGS

BAKER

TEST BORING LOG

BOREHOLE NUMBER: 3-NA-SB03
SHEET: 1 OF: 1

PROJECT NUMBER: 62470-274
PROJECT NAME: SITE 3 - OLD CREOSTE PLANT
LOCATION: MCB CAMP LEJEUNE, NC
DRILLING COMPANY: HARDIN-HUBER, INC.
RIG TYPE & NUMBER: ATV
DRILLING METHOD: HOLLOW STEM AUGERS
WEATHER: SUNNY
GEOLOGIST: R.M. LEWIS
ENV. SCIENTIST: A.M. BERNHARDT
DATE BEGUN: 11/16/94 DATE COMPLETED: 11/16/94

GROUND SURFACE ELEVATION: 29.99' msl
TOTAL DEPTH: 9.0' bgs

Navy CLEAN, District III
Contract Task Order (CTO) 0274
IDW Sampling and Analysis
Operable Units No. 8, 11, and 12
MCB Camp Lejeune, North Carolina

Dear Ms. Landman:

This letter report describes the sample collection activities, analysis, results, and recommendations for the disposition of investigation-derived waste (IDW) present at Sites 16, 7, 80, and 3, Marine Corps Base, Camp Lejeune, North Carolina. The IDW contained in 1,000 gallon tankers, 55 gallon drums, and lab packs, were generated during the period from September 15 to December 4, 1994, during the Baker Environmental, Inc. (Baker) remedial field investigation. An inventory of the IDW along with individual site quantities are provided in Table 1. Analytical results are provided in Attachment A.

Sample Collection and Analysis

Site 16

Two liquid samples were collected from Site 16. The first sample was collected from the well development and purge water holding tank and was given the sample identification 16-TK-01. Sample 16-TK-01 was analyzed for full Target Compound List (TCL)-Organics and Target Analytic List (TAL)-Inorganics.

The second sample was collected from a (55 - gallon) drum containing decontamination fluids. This sample was given the identification 16-DRM-01. Sample 16-DRM-01 was placed on ice and then was composited with decontamination fluids from other sites and given the sample identification 274-DRM-01. Sample 274-DRM-01 was analyzed for full TCL-Organics and TAL-Inorganics. The types and quantities of IDW for Site 16 are provided on Table 1. Analytical results for Site 16 are provided in Attachment A. Note, additional drums of decontamination fluids were also generated at lot 203 (field trailer). These drums were sampled along with all the site decontamination fluids and composited for sample 274-DRM-01. The decontamination fluids generated at Lot 203 are presented on Table 1.

Site 7

Two liquid samples were collected from Site 7. The first sample was collected from the well development and purge water holding tank and was given the sample identification 7-TK-01. Sample 7-TK-01 was analyzed for full TCL-Organics and TAL-Inorganics.

The second sample was collected by compositing two (55 - gallon) drums containing decontamination fluids. This sample was given the identification 7-DRM-01. Sample 7-DRM-01 was placed on ice and then was composited with decontamination fluids from other sites and given the sample identification 274-DRM-01.

Sample 274-DRM-01 was analyzed for full TCL-Organics and TAL-Inorganics. The types and quantities of IDW for Site 7 are provided on Table 1. Analytical results for Site 7 are provided in Attachment A.

Site 80

Two liquid samples were collected from Site 80. The first sample was collected from the well development and purge water holding tanks and was given the sample identification 80-TK-01. Sample 80-TK-01 was collected by compositing the water from both holding tanks, and was analyzed for full TCL-Organics and TAL-Inorganics.

The second sample was collected from a (55 - gallon) drum containing decontamination fluids. This sample was given the identification 80-DRM-01. Sample 80-DRM-01 was placed on ice and then was composited with decontamination fluids from other sites and given the sample identification 274-DRM-01. Sample 274-DRM-01 was analyzed for full TCL-Organics and TAL-Inorganics. The types and quantities of IDW for Site 80 are provided on Table 1. Analytical results for Site 80 are provided in Attachment A.

Site 3

One solid composite sample (3-RB-01) was collected from Site 3. This composite sample was comprised of drilling mud cuttings. One representative sample was collected from each of the six (55 - gallon) drums. These samples where in turn placed into a stainless steel bowl and homogenized prior to sample packaging. Sample 3-RB-01 was analyzed for RCRA hazardous waste characteristics including TCLP, ignitability, corrosivity, reactivity, and TCL PCBs.

Two liquid samples were collected from Site 3. The first sample was collected from the well development and purge water holding tank and was given the sample identification 3-TK-01. Sample 3-TK-01 was analyzed for full TCL-Organics and TAL-Inorganics.

The second sample was a composite sample from two (55 - gallon) drums of decontamination fluids. This sample was given the identification 3-DRM-01. Sample 3-DRM-01 was placed on ice and then was composited with decontamination fluids from other sites and given the sample identification 74-DRM-01. Sample 274-DRM-01 was analyzed for full TCL-Organics and TAL-Inorganics. The types and quantities of IDW for Site 3 are provided on Table 1. Analytical results for Site 3 are provided in Attachment A.

In addition to the solid and liquid IDW generated from Site 3, the ENSYS field screening investigation conducted at Site 3 generated approximately ten (10) liters of waste methanol. The waste methanol is stored in 10 - one liter glass bottles. These glass containers have been lab packed into two 5 - gallon plastic buckets with 5 containers in each bucket. A sample of the waste methanol was not collected due to waste methanol being a F - listed waste (F003), and proper disposal to a licensed Treatment Storage Disposal Facility (TSDF) is necessary.

Results

Site 16

Sample 16-TK-01 had only two positive volatile detections, one positive detection for semivolatiles, and no positive detections for pesticides/PCBs. Inorganic analysis did not indicate concentrations above what previous background groundwater analysis has indicated for inorganics. Concentrations of all contaminants did not exceed regulatory standards for classification as hazardous by characteristic (40CFR 261.24).

Sample 274-DRM-01 which is a composite sample of the decontamination fluids from all sites including Site 16, indicated positive detections for three volatile contaminants, five positive detections for semivolatiles, and one positive detection for pesticides. Inorganic analysis did not indicate concentrations above background for inorganics. Concentrations of all contaminants did not exceed regulatory standards for classification as hazardous by characteristic (40CFR 261.24).

Site 7

Sample 7-TK-01 had three positive volatile detections, and no positive detections for either semivolatile, or pesticide/PCB analysis. Inorganic analysis did not indicate concentrations above what previous background groundwater analysis has indicated for inorganics. Concentrations of all contaminants did not exceed 40CFR 261.24 standards.

Results of sample 274-DRM-01 which is a composite sample of the decontamination fluids from all sites, including Site 7, are provided in the results for Site 16.

Site 80

Sample 80-TK-01 had four positive volatile detections, and no positive detections for either semivolatile, or pesticide/PCB analysis. Inorganic analysis did not indicate concentrations above what previous background groundwater analysis has indicated for inorganics. Concentrations of all contaminants did not exceed 40CFR 261.24 standards.

Results of sample 274-DRM-01 which is a composite sample of the decontamination fluids from all sites, including Site 80, are provided in the results for Site 16.

Site 3

Sample 3-TK-01 had seven positive volatile detections, eleven positive semivolatile detections, and one positive detection for pesticides. Inorganic analysis did not indicate concentrations above previous background groundwater analysis has indicated for inorganics. Concentrations of all contaminants did not exceed 40CFR 261.24 standards.

Results of sample 274-DRM-01 which is a composite sample of the decontamination fluids from all sites, including Site 3, are provided in the results for Site 16.

Sample 3-RB-01 which was analyzed for RCRA hazardous waste characteristics, TCLP, and TCL-PCBs, had three positive volatile detections, and no positive detections for either semivolatiles and pesticides/herbicides. Also, PCB analysis indicated no positive detections, and inorganic analysis had one positive detection. Concentrations of all contaminants did not exceed 40CFR 261.24. Sample 3-RB-01 was not found to be reactive to sulfide and cyanide, be ignitable at less than 140 ° F, or be corrosive at less than 2 or greater than 12.

The waste methanol generated during the ENSYS soil investigation at Site 3 was not sampled. The methanol is a F - listed waste (F003), and proper disposal to a licensed TSDF is necessary.

Conclusions and Recommendations

Site 16

Analytical results indicate that samples 16-TK-01, and 274-DRM-01 have low level organic contaminant concentrations. These concentrations do not exceed regulatory values which would classify these samples as hazardous by characteristic. Therefore, the well development/purge water and the decontamination fluid will be disposed of onsite.

Site 7

Analytical results indicate that samples 7-TK-01, and 274-DRM-01 have low level organic contaminant concentrations. These concentrations do not exceed regulatory values which would classify these samples as hazardous by characteristics. Therefore, the well development/purge water and the decontamination fluid will be disposed of onsite.

Site 80

Analytical results indicate that samples 80-TK-01, and 274-DRM-01 have low level organic contaminant concentrations. These concentrations do not exceed regulatory values which would classify these samples as hazardous by characteristics. Therefore, the well development/purge water and the decontamination fluid will be disposed of onsite.

Site 3

Analytical results indicate that samples 3-TK-01, and 274-DRM-01 have low level organic contaminant concentrations. These concentrations do not exceed regulatory values which would classify these samples as hazardous by characteristics. Therefore, the well development/purge water and the decontamination fluid will be disposed of onsite.

Analytical results for sample (3-RB-01, drilling mud cuttings) indicate low level volatile contaminant concentrations. The RCRA hazardous waste characteristics show this sample to be non-hazardous. The TCLP and RCRA results do not exceed regulatory values which would classify this sample as hazardous by characteristics. Therefore, these drilling mud cuttings will be disposed of onsite.

The 10 liters of waste methanol will be packaged and removed from the base by a licensed waste hauler, and shipped to a licensed treatment, storage disposal facility (TSDF) for disposal in a certified fuels or incineration program.

Upon LANTDIV's approval of these disposal recommendations, the IDW will be managed as identified within this letter.

If you have any questions, please do not hesitate to contact me at (412) 269-2053.

Sincerely,

Baker Environmental, Inc.

Laboratory Name:	Quanterra-Knoxville	Job Number:	2220
Contract Name:	Quanterra-Export	Extraction Date:	12/06/94
Client Sample ID:	3-RB-01	Analysis Date:	12/08/94
Lab Sample ID:	AD2061	Confirmation Date:	N/A
Sample Matrix:	Soil	Concentration Units:	µg/kg

Compound	Concentration	Qualifier
Aroclor-1016	20	U
Aroclor-1232	20	U
Aroclor-1242 †	20	U
Aroclor 1248	20	U
Aroclor 1254	40	U
Aroclor 1260	40	U

† - Sample Aroclor pattern identified and/or calculated as Aroclor 1242.
U - Compound was analyzed for but not detected. The number is the detection limit for the sample.

Re: Contract N62470-89-D-4814
Navy CLEAN, District III
Contract Task Order (CTO) 0274
Operable Units No. 8, 11, and 12
Sites 3, 7, 16, and 80 IDW Removal
MCB Camp Lejeune, North Carolina

Dear Ms. Landman:

This letter report presents a summary of investigation-derived waste (IDW) disposal activities at Sites 3, 7, 16, and 80, Marine Corps Base, Camp Lejeune, North Carolina. The IDW generated during the remedial investigation conducted from October 10, 1994 through December 4, 1994, was contained in roll-off boxes, 1000 gallon tanks, and 55-gallon drums.

In a letter dated January 19, 1995, Baker Environmental provided the sample collection, analytical findings, conclusions and recommendations with respect to the IDW handling and disposal. The recommendations were subsequently approved by the Navy/Marine Corps. The remainder of this letter report provides a summary of the disposal activities conducted under this CTO.

DISPOSAL

Based on LANTDIV/MCB Camp Lejeune approval, Baker arranged for the disposal of the following:

- 3,850 gallons of nonhazardous well development and purge water
- 400 gallons of nonhazardous decontamination fluids
- 40 cubic feet of drilling mud

Based on the nonhazardous determination, all IDW was deposited back onto the site inwhich it was generated.

In addition, Baker arranged for Four Seasons Inc., (IDW subcontractor) to remove nine (9) liters of waste methanol from Lot 203. This waste was generated during the EnSys investigation performed at Site 3. The subcontractor was also required to transport the waste methanol to Ecoflo Inc., a licensed Treatment Storage Disposal Facility (TSDF) located in Greensboro, North Carolina. The signed hazardous waste manifest, along with the material characterization form, land disposal restrictions notification and certification form, lab pack certification, and drum inventories are provided in Attachment A.

If you have any questions, please do not hesitate to call me at (412) 269-2053 or Raymond P. Wattras (Activity Coordinator) at (412) 269-2016.

Sincerely,

BAKER ENVIRONMENTAL, INC.

ECOFLO LAB PACK CERTIFICATION

Generator Name: Marine Corp Base - Camp Lejeune

Manifest Doc. No.: F 1009

EPA ID Number: NC617 002 2580

State Manifest Doc. No.: _____

If your waste is packaged in lab packs and does NOT include waste codes listed on Appendix IV (see below), the following certification must be completed and the respective container numbers listed. Use additional sheets if necessary. If any lab pack containers INCLUDE waste codes listed in Appendix IV, the LDR Notification and Certification Form must be completed for those containers and the corresponding waste codes.

☐ Check this box if using a continuation sheet.

Container number(s):

MCB-01	MCB-02						

APPENDIX IV

Table 3 - Waste Management

(A) THIS RESTRICTED WASTE REQUIRES TREATMENT TO THE APPLICABLE STANDARD

This waste must be treated to the applicable treatment standard set forth in 40 CFR Part 268 Subpart D, 268.32, or RCRA Section 3004(d) prior to land disposal.

B THIS RESTRICTED WASTE HAS BEEN TREATED TO THE PERFORMANCE STANDARDS

I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the treatment process has been operated and maintained properly so as to comply with the performance levels specified in 40 CFR Part 268 Subpart D, and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA Section 3004(d) without impermissible dilution of the prohibited waste. I am aware that there are significant penalties for submitting a false certification, including the possibility of a fine and imprisonment.

C THIS RESTRICTED WASTE, FOR WHICH THE TREATMENT STANDARD IS EXPRESSED AS A SPECIFIED TECHNOLOGY, HAS BEEN TREATED BY THE SPECIFIED TECHNOLOGY

I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.42. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment.

D. THIS RESTRICTED WASTE CAN BE LAND DISPOSED WITHOUT FURTHER TREATMENT

I certify under penalty of law that I personally have examined and am familiar with the waste through analysis and testing or through knowledge of the waste to support this certification that the waste complies with the treatment standards specified is 40 CFR Part 268 Subpart D and all applicable prohibitions set forth on 40 CFR 268.32 or RCRA Section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification including the possibility of a fine and imprisonment.

E. THIS RESTRICTED DEBRIS HAS BEEN TREATED IN ACCORDANCE WITH 40 CFR 268.45

I certify under penalty of law that the debris has been treated in accordance with the requirements of 40 CFR 268.4 I am aware that there are significant penalties for making a false certification, including the possibility of fine a imprisonment.

Table 4 - Subcategories

WASTE CODES	KEY #	SUBCATEGORY
D001	1	High TOC ignitable liquids (High TOC NWW).
	2	Low TOC ignitable liquids managed in CWA, CWA-equivalent, or Class 1 SDWA systems.

Re: Contract N62470-89-D-4814
Navy CLEAN, District III
Contract Task Order (CTO) 0274
IDW Handling and Disposal
Operable Unit No. 12 (Site 3)
MCB Camp Lejeune, North Carolina

Dear Ms. Landman:

This letter report describes the sample collection activities, results, and recommendations for the disposition of investigative-derived waste (IDW) at Site 3, Marine Corps Base, Camp Lejeune, North Carolina.

The IDW at Site 3 is contained in two 1,000-gallon polyethylene tanks, and one 20-cubic yard roll-off box. It was generated during the period from June 12, 1995 through July 15, 1995 during the additional soil and groundwater investigation conducted at Site 3. An inventory of the IDW along with quantities are provided in Table 1. Analytical results are provided in Attachment A.

Sample Collection and Analysis: Site 3

One sample was collected from both of the two polyethylene tanks, composited into one sample, and given the sample identification 3-TK-01. Both tanks contain well development and purge water. The composite sample was analyzed for full Target Compound List (TCL) volatiles and semivolatiles. Pesticides, PCBs, and metals were not analyzed due to previous groundwater analytical results that indicated only volatile and semivolatile contamination.

Three grab samples were collected from varying locations within the roll-off box. These grab samples were placed within a stainless steel mixing bowl, homogenized into one composite sample, and given the sample identification 3-IDW-01. A representative sample was collected for volatile organics analysis prior to homogenizing the samples. This composite sample was analyzed for full Toxicity Characteristic Leachate Procedure (TCLP) and Resource Conservation Recovery Act (RCRA) characteristics (corrosivity, ignitability, and reactivity).

Results Site 3

Sample 3-TK-01 had four positive volatile detections, and nine positive semivolatile detections. Sample 3-IDW-01, which was analyzed for TCLP and RCRA characteristics, had no positive detections for organics. Inorganic analysis did not indicate concentrations above regulatory standards. In addition, sample 3-IDW-01 was not found to be reactive to sulfide and cyanide, ignitable at less than 140°F, or corrosive at less than or equal to 2 or greater than or equal to 12.5.

Conclusions and Recommendations Site 3

Analytical results indicate that samples 3-TK-01 and 3-IDW-01 have levels of organic contamination that do not exceed regulatory standards. Therefore, both the well development and purge water, and the drill cuttings and mud will be deposited back on-site. Additionally, the solids will be graded out over Site 3.

Upon LANTDIV's approval of these disposal recommendations, the IDW will be managed as identified within this letter.

If you have any questions, please do not hesitate to contact me at (412) 269-2053.

Sincerely,

BAKER ENVIRONMENTAL, INC.

Re: Contract N62470-89-D-4814
Navy CLEAN, District III
Contract Task Order (CTO) 0274
IDW Removal
Operable Unit No. 12 (Site 3)
MCB, Camp Lejeune, North Carolina

Dear Ms. Landman:

This letter report describes a summary of investigative-derived waste (IDW) disposal activities conducted at Operable Unit No. 12 (Site 3), Marine Corps Base, Camp Lejeune, North Carolina. The IDW generated during the additional remedial investigation activities conducted from June 12 through July 15, 1995, was contained in one roll-off box, and (two-1000 gallon) polyethylene tanks.

In a letter dated August 1, 1995, Baker Environmental provided the sample collection, analytical findings, conclusions, and recommendations with respect to the IDW handling and disposal. The recommendations were subsequently approved by the Navy/Marine Corps. The remainder of this letter report provides a summary of the disposal activities conducted under this CTO.

DISPOSAL

Based on LANTDIV/MCB Camp Lejeune approval, Baker arranged for the disposal of the following:

- 2,000 gallons of nonhazardous well development and purge water
- 10 cubic feet of nonhazardous drilling mud

Based on the nonhazardous determination, all IDW was deposited back onto Site 3 on August 15, 1995.

Baker appreciates the opportunity to serve LANTDIV on this important project. If you have any questions, please do not hesitate to call me at (412) 269-2053.

Sincerely,

BAKER ENVIRONMENTAL, INC.

APPENDIX E
AQUIFER CHARACTERIZATION DATA

A Q T E S O L V

A Program for

Automatic Estimation of Aquifer Coefficients

From Aquifer Test Data

By:

Glenn M. Duffield
and
James O. Rumbaugh, III

Geraghty & Miller Modeling Group
1895 Preston White Drive, Suite 301
Reston, VA 22091

(703) 476 - 0335

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- confined aquifers, unconfined aquifers, and leaky aquifers
- pumping tests, injection tests, recovery tests, and slug tests

Features:

- Interactive, menu-driven program design
- Nonlinear least-squares estimation of aquifer coefficients
- Statistical analysis of results
- Complete graphical display of results

TEST DESCRIPTION

Data set........... B:3MW07R.DAT
Data set title..... 3MW07 RISING HEAD TEST

Knowns and Constants:
No. of data points.................. 62
Radius of well casing............... 0.083
Radius of well...................... 0.25
Aquifer saturated thickness......... 8.97
Well screen length.................. 10
Static height of water in well...... 8.97
Log(Re/Rw).......................... 2.742
A, B, C............................. 0.000, 0.000, 2.297

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	4.2667E-003	+/-	5.1662E-004
y0 =	3.1091E+000	+/-	1.7024E-001

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
Number of residuals............... 62
Number of estimated parameters.... 2
Degrees of freedom................ 60
Residual mean..................... 0.06421
Residual standard deviation....... 0.4237
Residual variance................. 0.1795

TEST DESCRIPTION

Data set........... B:3MW02IWF.DAT
Data set title..... 3MW02IW FALLING HEAD TEST

Knowns and Constants:
- No. of data points.................. 37
- Radius of well casing............... 0.083
- Radius of well...................... 0.25
- Aquifer saturated thickness......... 58.06
- Well screen length.................. 15
- Static height of water in well...... 58.06
- Log(Re/Rw).......................... 3.972
- A, B, C............................. 0.000, 0.000, 2.989

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	1.2024E-002	+/-	1.1746E-003
y0 =	1.4853E+001	+/-	1.9635E+000

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 37
- Number of estimated parameters.... 2
- Degrees of freedom................ 35
- Residual mean..................... 0.1519
- Residual standard deviation....... 0.4856
- Residual variance................. 0.2358

Model Residuals:

Time	Observed	Calculated	Residual	Weight

APPENDIX F
BASE BACKGROUND SOIL REPORT

EVALUATION OF METALS IN SURFACE AND SUBSURFACE SOIL AT MCB, CAMP LEJEUNE

MARINE CORPS BASE
CAMP LEJEUNE, NORTH CAROLINA

CONTRACT TASK ORDER 0340

APRIL1, 1996

Prepared for:

DEPARTMENT OF THE NAVY
ATLANTIC DIVISION
NAVAL FACILITIES
ENGINEERING COMMAND
Norfolk, Virginia

Under the:

LANTDIV CLEAN Program
Contract N62470-89-D-4814

Prepared by:

BAKER ENVIRONMENTAL, INC.
Coraopolis, Pennsylvania

1.0 INTRODUCTION

Under the Department of the Navy (DoN) Installation Restoration Program (IRP). Baker Environmental, Inc. (Baker) has conducted numerous remedial investigations at Marine Corps Base (MCB), Camp Lejeune, North Carolina. As part of these investigations soil, surface and subsurface, samples have been collected. These samples provide the basis for a compilation of data that is representative of the natural concentration of metals in soils within the boundaries of MCB, Camp Lejeune. In general, chemical specific standards and criteria are not available for soil and as a result, base-specific background concentrations have been compiled from a number of locations throughout MCB, Camp Lejeune, allowing for the evaluation of background levels of metals in the surface and subsurface soils. The objectives of this report are as follows:

- To provide insight into the selection of soil locations used as control or background sample locations.
- To discuss general soil types encountered in each area that samples were collected.
- To provide the base background concentrations for each of the metals.
- To provide maps illustrating the locations of each of the background and/or control samples.

2.0 SELECTION OF SAMPLE LOCATIONS

The samples selected for inclusion into the basewide database were collected during nine Remedial Investigations including 23 sites. These samples were collected in areas not known to have been impacted by site operations or disposal activities based on the site histories. In some cases, these soils are representative of naturally occurring conditions and in other cases the soils have been impacted by other base related activities. In the later case the samples are referred to as "control" samples. Control samples are samples which may not represent background conditions, but represent the current state of soil quality upgradient of the site. Examples of activities that may not be site related but still impact the quality of the soils upgradient and across the entire site would include troop maneuvers, artillery practice, and various forms of combat training. Fifty-two surface and forty-six subsurface soil samples were collected from the following sites for inclusion into the base background data base: Sites 6, 78, 41, 69, 74, 1, 2, 28, 30, 35, 48, 16, 80, 7, 36, 43, 44, 54, 86, and 65 (see Figures 1 through 21).

Site background and base background concentration values for metal elements in surface and subsurface soil are presented in Tables 1 and 2, respectively. At the end of each of the tables, the minimum and maximum concentrations, the average and 2 times average concentrations are presented for each of the elements of concern.

3.0 GENERALIZED SOIL COMPARISON

MCB, Camp Lejeune is situated within the Tidewater region of the Atlantic Coastal Plain physiographic province. The sediments of the Atlantic Coastal Plain consist mostly of interbedded sand, silt, clay, calcareous clay, shell beds, sandstone and limestone. These sediments are layered in interfingering beds and lenses that gently dip and thicken to the southeast to a combined thickness of approximately 1,500 feet. These sediments were deposited in marine or near-shore environments and range in age from early Cretaceous to Quaternary time. Regionally, they comprise 10 aquifers and 9 confining units which overlie

igneous and metamorphic basement rocks of the pre-Cretaceous age. Seven of these aquifers and their associated confining units are present in the MCB, Camp Lejeune area (ESE, 1990).

For the basis of discussion, MCB, Camp Lejeune has been segregated into six areas that will be discussed. These areas are as follows: Camp Geiger, Marine Corps Air Station (MCAS), Mumford Point/Tarawa Terrace, Hadnot Point/Holcomb Boulevard, Rifle Range, and Courthouse Bay. The discussion will only involve the soil descriptions from borings advanced for the purpose of collecting background or control samples. In addition, only the soils between ground surface and the water table will be discussed since this is the interval from which the samples were collected.

Sites 35, 36, and 44 are considered within the boundaries of Camp Geiger for the purpose of this report. Fairly consistent soil types were encountered at the three sites considered within the Camp Geiger area. Some of these sites may actually be located just beyond the actual boundaries of Camp Geiger. Soils collected from ground surface to one foot below surface at the forementioned sites were primarily sand with varying amounts of silt.

The soils within MCAS (Sites 41, 43, 48, 54, and 86) are vary inconsistent throughout the area. Background boring logs indicate that sand, silt and clay are encountered to a depth of nine feet. This area of Camp Lejeune has numerous lenses of clay that can range from one to several feet thick, and is discontinuous. One location encountered clay within Site 41 from the zero to one foot interval. The soils from one to seven feet were a combination of sands, silts and clays.

The soils at the Mumford Point/Tarawa Terrace area (Sites 7, 16, and 80) are similar to the soils in the area of Camp Geiger. The first foot of soil appears to be consistently sand and silt with the exception of two locations which specify that clay was encountered. Clay was encountered at Sites 7 and 80. Below one foot bgs the soils are consistently interbedded sand and silt with discontinuous clay beds.

Sites 1, 6, 28, 30 and 74 make up the Hadnot Point/Holcomb Boulevard area. The soils encountered in this area of MCB, Camp Lejeune were primarily sand with varying percentages of silt and clay. This lithology is consistent to depths greater than 19 feet.

Limited information exists from the Rifle Range area. The only site included in the background data is Site 69. The background borings were advanced only to one foot bgs. The soil type encountered at each location was sand. Monitoring wells installed at Site 69 indicate a predominance of fine sand with trace silt present in the subsurface soil. However, within a few monitoring wells, subsurface soils indicate the presence of clay with fine to medium sand and trace silts.

The Courthouse Bay area is comprised of Site 65. The soil types described at Site 65 indicate that sand is the predominant soil from ground surface to 17 feet bgs. At Site 65 a clay was encountered between nine and 11 feet bgs, with sand being encountered again to a groundwater.

Tables 3 and 4 provide a summary of surface soil and subsurface soil, respectively for the sites referenced above.

TABLE OF CONTENTS

1.0 INTRODUCTION

Numerous groundwater investigations have been conducted at Marine Corps Base (MCB), Camp Lejeune under the Department of the Navy (DON) Installation Restoration Program (IRP). These studies have identified elevated levels of total metals in shallow groundwater at almost every site. The degree of contamination, based on dissolved metals analysis of groundwater samples, is limited. It is believed that the presence of elevated metals are not always related to past disposal activities for several reasons, which is the basis of this study.

Currently, Records of Decision (ROD) are being prepared for Operable Units No. 1 (Sites 21, 24, and 78) and No. 5 (Site 2). Both RODs are proposing to not remediate shallow groundwater which contains elevated levels of total metals above State groundwater standards (i.e., North Carolina Water Quality Standards) and/or Federal drinking water standards (i.e., Maximum Contaminant Levels). Specifically, remediation of shallow groundwater due to elevated total metals is not cost effective, or practical, due to the following: (1) the shallow aquifer is not used for potable supply; (2) the source of metals in groundwater cannot be correlated with soil data or previous disposal practices; (3) the extent of shallow groundwater contamination (based on total metals analysis) is widespread and in many cases undefinable, since there are no apparent contaminant plumes or patterns associated with the metals; and (4) deep groundwater, which is the source of potable water, is not significantly contaminated with metals above the standards.

2.0 STUDY OBJECTIVES

The DON/Marine Corps initiated a study on inorganics in groundwater throughout MCB Camp Lejeune to assess whether total metals in groundwater are related to disposal practices or to other factors. The overall goal of this study is to provide information that would be used in consideration of not remediating shallow groundwater at Operable Units No. 1 and No. 5, and possibly other operable units where total metals are elevated without cause. The following study objectives were identified:

(1) Determine whether the elevated total metals detected in the shallow aquifer are related to past disposal practices, well construction factors, sampling techniques, or suspended particulates in the samples;

(2) Determine whether total metals in shallow groundwater are elevated throughout the region or MCB Camp Lejeune;

(3) Determine whether there is a correlation between elevated total metals in groundwater and metals in soil; and

(4) Determine whether the concentrations of total metals (i.e., low versus high) is related to shallow and deep aquifer characteristics.

3.0 SCOPE OF WORK

Groundwater and soil data from a total of 21 sites were compiled as part of the overall study. Three of the 21 sites are located outside the boundary of the base. These sites include the ABC Cleaners Superfund Site, located along Route 24 in Jacksonville, and two sites located along Highway 17 (Off-site Properties No. 1 and No. 2). The two sites along Route 17 were investigated by the DON/Marine Corps as part of a real estate survey. The other 18 sites are located throughout various portions of MCB Camp Lejeune (see Figure 1).

Information from studies conducted by Baker and other consultants were obtained to evaluate metal concentrations in groundwater. The study focused on 14 metals of potential concern to human health and the environment. Some of the information was collected under the IR Program whereas other information was obtained during other investigations (e.g., ABC Cleaners RI/FS). The following data tables were then prepared to determine why total metals are generally elevated in shallow groundwater.

Table 1 - Total Metal Concentrations in Shallow Groundwater by Site

Table 2 - Summary of Repeat Sampling of Shallow Wells (Sites 2 and 78)

Table 3 - Dissolved Metal Concentrations in Shallow Groundwater by Site

Table 4 - Summary of Total Metal Concentrations in Upgradient Wells

Table 5 - Comparison of Subsurface Metal Concentrations in Uncontaminated and Contaminated Wells

Table 6 - Total Metal Concentrations in Deep Groundwater by Site

Table 7 - Summary of Field Parameters in Shallow Monitoring Wells, Deep Monitoring Wells, and Supply Wells

The tables are presented at the end of this report.

4.0 DATA ANALYSIS

The following discussion represents an analysis of the information contained in each of the previously mentioned tables.

Table 1 (Total Metal Concentrations in Shallow Groundwater)

All of the sites had at least one (and in most cases several) metal which exceeded either State water quality standards or Federal drinking water standards. The most frequently detected metals included chromium, lead, and manganese, which were detected at almost every site above drinking water standards. Other frequently detected metals which exceeded drinking water standards included arsenic, beryllium, cadmium, and nickel.

An analysis of the data from Table 1 indicates that elevated total metals are present in shallow groundwater at every site, including the three sites which are located off base. The two sites which did not exhibit significant contamination include the ABC Cleaners site (only chromium exceeded the standards) and Site 48 (only manganese exceeded the standards).

Total metals detected in shallow groundwater at Site 2 exceeded State and/or Federal standards in seven of the 11 shallow monitoring wells. Manganese was the most frequently detected metal (7/11). Lead (3/11), chromium (2/11), and cadmium (1/11) were also detected above the standards,, but less frequently (see Figure 2).

With the exception of Wells 78GW03 and 78GW19, total metals were detected at Site 78 (Hadnot Point Industrial Area) above Federal MCLs or NCWQS in every shallow well (see Figure 3). The extent of elevated total metals in groundwater is widespread, encompassing approximately one square mile (or approximately 660 acres) in total area. The distribution and concentration of total metals in shallow groundwater makes it virtually impossible to identify or illustrate contaminant plumes (see Figure 3).

An analysis of the total metals results indicates the following pattern. Samples exhibiting elevated levels of lead, chromium, or other contaminants of concern, also exhibited elevated levels of other metals such as aluminum, antimony, iron, and zinc. Samples which did not exhibit elevated levels of lead, chromium, or manganese also did not exhibit elevated levels of other metals. This pattern indicates that the elevated total metals are not limited to one or

two contaminants, which would be the case if a lead or chromium plume in the groundwater truly existed. In other words, if a site is impacted by a particular metal due to disposal activities (say chromium for example), then other metals such as aluminum, lead, or zinc should not be consistently elevated as in the case of samples collected from the shallow aquifer at MCB Camp Lejeune. This point is depicted in the data summary tables provided in Appendix A for Sites 2 and 78. These tables were taken from the Remedial Investigation Reports for Operable Units No. 1 and No. 5. As an example, note that sample numbers 78-MW08, 78-MW10, 78-MW11, and 78-MW12 all had elevated levels of total metals when compared to samples 78-MW09-2 and 78-MW09-3. It is clear that most of the metal concentrations in a particular sample follow a consistent pattern throughout.

Table 2 (Comparison of Repeat Sampling of Shallow Wells

Five wells from Sites 2 and 78 were randomly chosen to evaluate total metals concentrations between sampling rounds. The comparison was limited to only chromium, lead, and manganese since these contaminants were frequently detected throughout MCB Camp Lejeune. In several cases, metal concentrations were significantly different between the sampling rounds. If the shallow aquifer was impacted due to former disposal activities, a contaminant plume would be present and concentrations would not significantly deviate. The deviation in metal concentrations may indicate that sampling results are biased due to suspended particulates in the samples.

Table 3 (Dissolved Metal Concentration in Shallow Groundwater by Site)

The data base for Table 3 was limited to 12 sites since many of the previous investigations (i.e., prior to Navy CLEAN) did not analyze for dissolved metals. Nevertheless, an analysis of the 12 sites revealed that elevated levels of dissolved metals in groundwater is limited. Manganese was the most frequently detected metal above drinking water standards (10 of 12 sites exhibited elevated levels). Lead was detected at only one site (Site 21) above drinking water standards. Chromium was also detected at only one site (Site 78) above drinking water standards. No other metal was detected above the standards.

Literature searches have indicated that manganese is a naturally occurring metal in North Carolina. Therefore, the presence of manganese may not be attributable to site-related activities (Greenhorne & O'Mara, 1992).

An analysis of the data from Table 3 clearly shows a significant reduction in metal concentrations when compared to Table 1 (total metals in shallow groundwater). One possible reason for this reduction is that suspended solids or particles are not being introduced into the analysis of the sample due to filtering. A second possibility is that the metals are not significantly present in a dissolved state in shallow groundwater due to the species of metals under site conditions. It should be noted that calcium and sodium did not exhibit such a pattern since the salts of these metals are more soluble in water. For example, the concentrations of total calcium and total sodium versus dissolved calcium and dissolved sodium are similar and are not affected by the removal of the particulates during filtering. The fact that these salts do not exhibit the pattern that the other metals show supports the possibility that total metal concentrations are influenced by particulates in the sample.

Table 4 (Total Metals in Upgradient Shallow Wells)

The data base for Table 4 consists of groundwater results from 14 upgradient shallow monitoring wells (i.e., one well per site). These wells were installed to determine baseline groundwater quality to which on-site groundwater conditions could be compared. In some cases, the upgradient wells were located in areas where other base activities may have influenced groundwater quality.

The analysis of this data shows that manganese was the most frequently detected metal above Federal or State standards in upgradient shallow wells. Manganese was detected in 7 of the 14 upgradient wells above drinking water standards. Chromium and lead were also frequently detected above drinking water standards in upgradient (background) wells. These contaminants were detected in 6 of the 14 upgradient wells. At Site 2, samples collected from an upgradient well (2GW9) exhibited elevated levels of chromium (83µ/l), lead (27.2µ/l) and manganese (747µ/l). At Site 78, samples collected from upgradient wells 96W4 and 78GW26 did not exhibit elevated levels of total metals. The concentration range for metals detected above NC WQS and/of Federal MCLs in upgradient wells is provided below:

- beryllium (ND-46.5 µ/l)
- cadmium (ND-10 µ/l)
- chromium (ND-198 µ/l)
- lead (ND-78.8 µ/l)
- manganese (ND-747 µ/l)
- mercury (ND-1.6J µ/l)

Based on the above range representing upgradient wells, none of the on-site wells at Site 2 exhibited total metals above the maximum background concentrations. However, at Site 78, lead and chromium were detected above the maximum background in several on-site wells.

An analysis of the data from Table 4 indicates that shallow groundwater upgradient of some sites contains total metals above drinking water standards. A comparison of Table 4 data against Table 1 data indicates that shallow groundwater samples from upgradient wells are less contaminated than samples collected from on-site monitoring wells. However, it should be noted that the data base for Table 4 consists of only 14 wells whereas the data base for Table 1 consists of over 130 wells. Therefore, to assume that upgradient groundwater quality is better than on-site groundwater quality may not be justified due to the different data bases.

Table 5 (Comparison of Subsurface Metal Concentrations in Uncontaminated and Contaminated Wells)

The purpose of this table is to determine whether metal concentrations in soils correlate with the elevated levels of metals in shallow groundwater.

To evaluate this, metals in subsurface soils, representing an area of groundwater contamination, were compared to metals in subsurface soil in areas which did not exhibit groundwater contamination. If the elevated total metals in shallow groundwater are present due to former disposal activities, subsurface metals in soil representing an area of groundwater contamination would be expected to be elevated or higher than metals in subsurface soil representing a non-contaminated area. This evaluation assumes that the well exhibiting elevated total metals is within a source area and that the soil sample is representative of soil impacted by metal contamination.

As shown on Table 5, there is no clear pattern or correlation which indicates that elevated total metals are due to soil contamination. Note that in many cases, the concentration of metals which represent "non-contaminated" areas are greater than the metals which represent "contaminated" areas. Also note that the metals in subsurface soil are within or close to background subsurface metal concentrations. Therefore, this supports the possibility that in many cases at MCB Camp Lejeune, the elevated total metals in shallow groundwater cannot be attributable to a source or to past disposal practices.

Table 6 (Total Metals in Deep Monitoring Wells)

Table 6 presents total metal concentrations in deep groundwater for each site. The data base is limited to only 8 sites. Metal concentrations in supply wells were also included for comparison purposes.

As shown on Table 6, total metals in deep groundwater are below drinking water standards with a few exceptions. Arsenic and cadmium were detected above the standards in one deep monitoring well at Site 78 (see Figure 4). Manganese was detected in deep groundwater at three sites and a few of the supply wells. Lead was detected in one supply well at 16 µ/l, which is slightly above the drinking water standard of 15 µ/l.

Elevated total metals are not widespread in deep groundwater for two possible reasons. First, most metals are not very mobile in the environment. Second, deep groundwater samples may not have significant amounts of suspended particulates due to different geologic conditions. Soils in the deeper aquifer are more compacted and consist primarily of calcareous sands, clays, and limestone fragments. Soils in the shallow aquifer are loosely compacted and consist primarily of fine-grained sands, silts, and clays. This classification may support the possibility that suspended solids are collected during sampling, thereby influencing the analysis for total metals.

Table 7 (Summary of Field Parameters in Shallow, Deep, and Supply Wells)

Table 7 provides a range of pH and specific conductivity values representative of shallow and deep groundwater. In general, lower pH values were noted more often in shallow wells than in deep wells (including the supply wells). This condition may influence the leachability and speciation of metals in groundwater.

Deep groundwater usually exhibited higher specific conductivity values. High specific conductivity values are representative of high dissolved conditions. The fact that deep groundwater generally exhibited higher specific conductivity values indicates that most of the metals, if present, are in a dissolved state. The high specific conductivity values could also indicate less suspended particulates due to the geologic conditions of the deep aquifer. The lower specific conductivity values observed in shallow wells indicates that the metals in the shallow aquifer are not in a dissolved state. This also supports the possibility that suspended particulates in the shallow aquifer are influencing the analysis of total metals.

5.0 ANALYSIS OF THE STUDY OBJECTIVES

Each of the objectives identified for this study are analyzed below based on the information collected.

Objective No. 1 (Determine whether the elevated total metals in the shallow aquifer are related to past disposal practices, well construction factors, sampling techniques, or suspended particulates in the samples)

Based on the analysis of information provided in Tables 1 through 7 and Appendix A, it appears that suspended particulates in groundwater samples could influence the concentration of total metals in groundwater. Well construction factors and sampling techniques are probably not a significant factor since the data base is representative of data obtained by Baker, ESE (Site 28 and 30), Roy F. Weston (ABC Cleaners), and Halliburton NUS (Site 7). No particular pattern was noted between sites which Baker obtained the samples versus sites in which other consultants obtained the data. Sampling methods were also considered. For Sites 63 and 65 for example, samples were collected with a bailer. At Sites 2 and 78, samples were collected with a low flow pump. All four sites exhibited elevated levels of total metals in groundwater samples. In addition, due to the fact that deep groundwater quality is not significantly impacted with metals indicates that well construction or sampling techniques are probably not factors related to elevated total metals in groundwater.

With respect to past disposal practices, Table 5 clearly shows that soil concentrations do not correlate with elevated total metals in groundwater. Based on this analysis, and on many of the sites previously investigated, the source of total metals in groundwater cannot be attributable to soil contamination or disposal practices in many cases. This is based on both the history of the site as well as the analytical soil results. In some cases, total metals were detected at elevated levels even when the site history did not correlate with the contaminants found. For example, Sites 2 and 21 have a history of pesticide storage and handling, and there are no known disposal areas (i.e., buried debris) within the site boundary. Nevertheless, both of these sites exhibited several metals above drinking water standards that would not be expected to be present at high concentrations based on the historical use of the site. These metals included lead, chromium, beryllium, cadmium, and manganese.

Objective No. 2 (Determine whether total metals in shallow groundwater are elevated throughout the region or MCB Camp Lejeune)

Based on groundwater data obtained from both upgradient wells and off base wells, total metals were detected above drinking water standards in shallow groundwater in areas that would not be influenced by former disposal activities at the sites. Given that some of the upgradient wells are contaminated, it is apparent that total metals in shallow groundwater are elevated in certain areas of the base outside of the influence of site-related disposal activities. However, it is unknown whether the shallow aquifer upgradient of the sites is contaminated due to other base-related activities or whether the levels in groundwater samples are also elevated due to the influence of suspended fines in the samples.

Objective No. 3 (Determine whether there is a correlation between elevated total metals in groundwater and metals in soil)

An evaluation of the data presented in Table 5 shows that metals in soil samples collected in areas of groundwater contamination are not elevated when compared to metals in soil samples collected in areas that did not exhibit groundwater contamination. This supports the possibility that in many cases, elevated levels of total metals in shallow groundwater are not related to the disposal history at the site. As previously mentioned, sites which did not exhibit soil contamination (when compared to background soil levels) or did not have a history of disposal indicative of metals contamination still exhibited elevated levels of total metals in groundwater. Since there is no apparent correlation between metals in soil and total metals in groundwater, then the possibility exists that the elevated total metals in groundwater are biased high due to suspended particulates.

Objective No. 4 (Determine whether the concentrations of total metals in groundwater is related to shallow and deep aquifer characteristics)

There is some evidence that the geologic conditions of the shallow and deep aquifers influence the amount of total metals detected in groundwater samples. The fact that the deep aquifer generally exhibited higher specific conductivity values indicates that there is more dissolved constituents in the deep aquifer when compared to the shallow aquifer. This was evident when comparing Table 1 (total metals in shallow groundwater) to Table 6 (total metals in deep groundwater). Table 6 did not indicate significant levels of total metals in deep groundwater throughout MCB Camp Lejeune.

The geologic conditions of the shallow aquifer would tend to result in samples that may contain suspended particulates. The suspended particulates could influence the total metals concentrations in the samples.

6.0 CONCLUSIONS

1. Elevated levels of total metals in the shallow aquifer are probably influenced to some degree by the geologic conditions of the site.

2. There is no correlation between metal levels in soil and total metals in groundwater. Therefore, elevated total metals in groundwater cannot be attributable to soil contamination of past disposal practices.

3. Elevated levels of total metals in the shallow aquifer may be biased high due to suspended particulates in the samples.

4. Dissolved metals in groundwater were generally below Federal MCLs and NC WQS and therefore, do not present a significant problem at MCB Camp Lejeune.

5. Total and dissolved metal concentrations in the Castle Hayne aquifer were generally below drinking water standards and therefore, do not present a significant problem at MCB Camp Lejeune.

6. The presence of manganese in shallow and deep groundwater may be due to naturally occurring geologic conditions.

7.0 RECOMMENDATIONS

1. Remediation of total metals in the shallow aquifer at Operable Units 1 and 5 is not recommended based on the following:

   - Elevated metals in groundwater at both operable units does not appear to be related to soil contamination or past disposal practices;
   - The distribution of total metals in groundwater is not characteristic of a plume that would be present due to a source of contamination;
   - Remediation of total metals would not be practical from an engineering or cost standpoint; and
   - Currently, there is no human or environmental exposure to shallow groundwater.

2. Additional background wells should be installed at all sites in order to provide a baseline for comparing on-site groundwater quality.

SURFACE SOIL INGESTION EXPOSURE ASSESSMENT
OPERABLE UNIT NO. 12 (SITE 3)
REMEDIAL INVESTIGATION CTO-0274
MCB CAMP LEJEUNE, NORTH CAROLINA
FUTURE RESIDENTIAL CHILD

Intake from ingestion of soil is calculated as follows:

Intake (mg/kg-day) = C * CF * EF * ED * IR/BW * ATc or ATnc * DY

Risk = Intake * CSF or /RfD

Where:

	INPUTS
C = contaminant concentration in soil (mg/kg)	1E-06
CF = conversion for kg to mg	350
EF = child exposure frequency (days/yr)	6
ED = child exposure duration (yr)	200
IR = child soil ingestion rate (mg/day)	15
BW = child body weight (kg)	70
ATc = averaging time for carcinogen (yr)	6
ATnc = averaging time for noncarcinogen (yr)	365
DY = days per year (days/year)	specific
CSF = cancer slope factor (mg/kg-day)-1	specific
RfD = reference dose (mg/kg-day)	

COPC	Concentration (mg/kg)	Exposure Frequency (days/yr) Child	Exposure Duration (yr) Child	Conversion Factor (kg/mg)	Ingestion Rate (mg/day) Child	Body Weight (kg) Child	Average Carc Time (days)	Carc Dose (mg/kg/day) Child	Slope Factor (mg/kg/day)-1	Carcinogenic Risk Child	Percent Carcinogenic Risk Child	Average Noncarc Time (days)	Noncarc Dose (mg/kg/day) Child	Reference Dose (mg/kg/day)	Noncarcinogenic Risk Child	Percent Noncarcinogenic Risk Child

CERTIFICATE OF ANALYSIS

December 29, 1994

Jackie Waddell
Quanterra Environmental Services
5815 Middlebrook Pike
Knoxville, TN 37921

ETDC Project Number: 483569.01 Client Purchase Order: 130789

This is the Certificate of Analysis for the following samples:

Client Project ID:	BAKER
Date Received by Lab:	November 17 and 23, 1994
Number of Samples:	Four (4)
Sample Type:	Soil

I. Introduction/Case Narrative

Four soil samples were received by the IT/ETDC Geotechnical Laboratory on November 17 and November 23, 1994. Requested testing included natural moisture content, particle-size analysis, cation-exchange capacity, bulk density, and porosity. Not all samples required all parameters.

Please see Appendix A, Sample Number Cross Reference List; Appendix B, Analysis Results; and Appendix C, Chain of Custody and Request for Analysis Records; and Appendix D, Variance Documents for specific sample information..

United States Army Corps of Engineers Laboratory Soils Testing, Engineering Manual EM1110-2-1906, and Environmental Protection Agency (EPA), Test Methods for Evaluating Solid Waste, SW846.

Moisture Content	ASTM D 2216
Particle-Size Analysis	ASTM D 422
Cation-Exchange Capacity	EPA SW846, 9081
Bulk Density	EM1110-2-1906, Appendix II
Porosity	EM1110-2-1906, Appendix II

III. Quality Control

Quality control checks such as duplicates and spikes (QC samples), are not normally applicable to geotechnical testing. This is due to the inability of obtaining samples with known characteristics, the heterogenous nature of the samples, and Quality Control procedures built-in to the analytical method.

QC measures to ensure accuracy and precision of test results include the following:

- 100% verification on all numerical results - all raw data entries, transcriptions and calculations entered by lab technicians are checked, recalculated and verified. Most data calculations are performed by computer programs.
- Data validation through test reasonableness - summaries of all test results for individual reports are reviewed to determine the overall reasonableness of data and to determine the presence of any data that may be considered outliers.
- Quality control procedures are built into most standardized geotechnical procedures. For example, many analyses routinely call for a re-analysis, specifying an acceptance criteria.
- Routine instrument calibration - all instruments, gauges and equipment used in testing are calibrated on a routine basis. All instrument calibration follows ASTM or manufacturer guidelines.

IT ENVIRONMENTAL TECHNOLOGY
DEVELOPMENT CENTER
OAK RIDGE, TN
(615) 482-6497

- Maintenance of all past calibration records - records and certification documents of all instruments, gauges and equipment are updated routinely and maintained in the Quality Control Coordinators Quality/Operations files.

- Use of trained personnel for conducting tests - all technicians are trained in the application of standard laboratory procedures for geotechnical analyses as well as the quality assurance measures implemented by IT.

IV. Data Qualification

Moisture contents are calculated in accordance with ASTM D 2216. Given results are based on the sample dry weight, not on the sample wet weight as is common in analytical chemistry.

Bulk density and porosity data was requested for sample number AD0564 (ETDC-6186). These tests were not performed because the sample was highly disturbed upon receipt and would not have yielded results corresponding to in-situ soil conditions. Please see Appendix D of this report for a copy of the variance documenting the sample condition.

The cation exchange procedure included analysis of a blank, duplicate and matrix spike. The blank was found to be below the detection limit of 0.4 mg/l. The relative percent difference for the duplicate sample was found to be 0.4%. The percent recovery for the spike sample was found to 103.0%.

APPENDIX N
CDI CALCULATIONS AND SPREADSHEETS

Computed by: :LHJ Checked by: MDB Date: 12/95

EXAMPLE SOIL INGESTION CALCULATIONS
OPERABLE UNIT NO. 12 (SITE 3)
CONTRACT TASK ORDER 0274

Purpose: Estimate intake/risk from ingestion of soil

$$Intake\ (mg/kg{\cdot}day) = \frac{C \times CF \times EF \times ED \times IR}{BW \times AT}$$

Where:	C	=	Contaminant concentration in soil (mg/kg)
	CF	=	Conversion factor (kg/mg)
	EF	=	Exposure frequency (days/year)
	ED	=	Exposure duration (years)
	IR	=	Ingestion rate (mg/day)
	BW	=	Body weight (kg)
	AT_c	=	Averaging time carcinogen (days)
	AT_{nc}	=	Averaging time noncarcinogen (days)

Risks:

Carcinogens = Intake (mg/kg·day) x CSF $(mg/kg{\cdot}day)^{-1}$
Noncarcinogens = Intake (mg/kg·day)/RfD (mg/kg·day)

Example Carcinogen: benzo(a)pyrene

$$Intake\ (mg/kg{\cdot}day) = \frac{0.7191\ mg/kg \times 100\ mg/day \times 350\ days/yr \times 24\ yrs \times 1.0E{-}6\ kg/mg}{70\ kg \times 25{,}550\ days}$$

$$= 3.38E\text{-}07$$

Risk = 3.38E-07 mg/kg·day x 7.30E+00 $mg/kg{\cdot}day^{-1}$ = 2.47E-06

Example Noncarcinogen:

There are no noncarcinogens retained as COPCs.

Re: Site 3 Future Residential Adult

SURFACE SOIL INGESTION EXPOSURE ASSESSMENT
OPERABLE UNIT NO.12 (SITE 3)
REMEDIAL INVESTIGATION CTO-0274
MCB CAMP LEJEUNE, NORTH CAROLINA
FUTURE RESIDENTIAL ADULT

Intake from ingestion of soil is calculated as follows:

Intake (mg/kg-day) = C * CF * EF * ED * IR/BW * ATc or ATnc * DY

Risk = Intake * CSF or /RfD

Where:		INPUTS
C = contaminant concentration in soil (mg/kg)		
CF = conversion for kg to mg		1E-06
EF = adult exposure frequency (days/yr)		350
ED = adult exposure duration (yr)		24
IR = adult soil ingestion rate (mg/day)		100
BW = adult body weight (kg)		70
ATc = averaging time for carcinogen (yr)		70
ATnc = averaging time for noncarcinogen (yr)		24
DY = days per year (days/year)		365
CSF = cancer slope factor (mg/kg-day)-1	specific	
RfD = reference dose (mg/kg-day)	specific	

COPC	Concentration (mg/kg)	Exposure Frequency (days/yr) Adult	Exposure Duration (yr) Adult	Conversion Factor (kg/mg)	Ingestion Rate (mg/day) Adult	Body Weight (kg) Adult	Average Carc Time (days)	Carc Dose (mg/kg/day) Adult	Slope Factor (mg/kg/day)-1	Carcinogenic Risk Adult	Percent Carcinogenic Risk Adult	Average Noncarc Time (days)	Noncarc Dose (mg/kg/day) Adult	Reference Dose (mg/kg/day)	Noncarcinogenic Risk Adult	Percent Noncarcinogenic Risk Adult

EXAMPLE DERMAL CONTACT WITH SOIL CALCULATIONS
OPERABLE UNIT NO. 12 (SITE 3)
CONTRACT TASK ORDER 0274

Purpose: Estimate intake/risk from dermal contact with soil

$$Intake\ (mg/kg{\cdot}day) = \frac{C \times CF \times SA \times AF \times Abs \times EF \times ED}{BW \times AT}$$

Where:	C	=	Contaminant concentration in soil (mg/kg)
	CF	=	Conversion factor (kg/mg)
	SA	=	Surface available for contact (cm^2/event)
	AF	=	Soil to skin adherence factor (mg/cm^2)
	Abs	=	Fraction absorbed (percent)
	EF	=	Exposure frequency (days/year)
	ED	=	Exposure duration (years)
	BW	=	Body weight (kg)
	AT_c	=	Averaging time carcinogen (days)
	AT_{nc}	=	Averaging time noncarcinogen (days)

Risks:

Carcinogens = Intake (mg/kg·day) x CSF $(mg/kg{\cdot}day)^{-1}$
Noncarcinogens = Intake (mg/kg·day)/RfD (mg/kg·day)

Example Carcinogen: benzo(a)pyrene

$$ke\ (mg/kg{\cdot}day) = \frac{0.7191\ mg/kg \times 1.0E{-}06\ kg/mg \times 5{,}800\ cm^2/event \times 1\% \times 1\ mg/cm^2 \times 350\ event/yr \times 24}{70\ kg \times 25{,}550\ days}$$

= 1.96E-07

Risk = 1.96E-07 mg/kg·day x 7.30E+00 $mg/kg{\cdot}day^{-1}$ = 1.43E-06

Example Noncarcinogen:

There are no noncarcinogens retained as COPCs.

EXAMPLE INHALATION OF PARTICULATES CALCULATIONS
OPERABLE UNIT NO. 12 (SITE 3)
CONTRACT TASK ORDER 0274

Purpose: Estimate intake/risk from the inhalation of soil particulates

$$Intake\ (mg/kg{\cdot}day) = \frac{C \times IR \times EF \times ED \times 1/PEF}{BW \times AT}$$

Where:	C	=	Contaminant concentration in soil (mg/kg)
	IR	=	Inhalation rate (m^3/day)
	EF	=	Exposure frequency (days/year)
	ED	=	Exposure duration (years)
	PEF	=	Particulate Emission Factor (m^3/kg)
	BW	=	Body weight (kg)
	AT_c	=	Averaging time carcinogen (days)
	AT_{nc}	=	Averaging time noncarcinogen (days)

Risks:

Carcinogens = Intake (mg/kg·day) x CSF $(mg/kg{\cdot}day)^{-1}$
Noncarcinogens = Intake (mg/kg·day)/RfD (mg/kg·day)

Example Carcinogen: benzo(a)pyrene

$$Intake\ (mg/kg{\cdot}day) = \frac{0.7191\ mg/kg \times 20\ m^3/day \times 350\ days/yr \times 24\ yrs \times 1/6.79E{+}08\ m^3/kg}{70\ kg \times 25{,}550\ days}$$

$$= 9.95E\text{-}11$$

Risk = 9.95E-11 mg/kg·day x 6.10E+00 $mg/kg{\cdot}day^{-1}$ = 6.07E-10

Example Noncarcinogen:

There are no noncarcinogens retained as COPCs.

EXAMPLE GROUNDWATER INGESTION CALCULATIONS (Round 2 only)
OPERABLE UNIT NO. 12 (SITE 3)
CONTRACT TASK ORDER 0274

Purpose: Estimate intake/risk from ingestion of groundwater

$$Intake\ (mg/kg{\cdot}day) = \frac{C \times IR \times EF \times ED}{BW \times AT}$$

Where:			
	C	=	Contaminant concentration in groundwater (mg/L)
	IR	=	Daily intake ingestion rate (L/day)
	EF	=	Exposure frequency (days/year)
	ED	=	Exposure duration (years)
	BW	=	Body weight (kg)
	AT_c	=	Averaging time carcinogen (days)
	AT_{nc}	=	Averaging time noncarcinogen (days)

Risks:

Carcinogens = Intake (mg/kg·day) x CSF $(mg/kg{\cdot}day)^{-1}$
Noncarcinogens = Intake (mg/kg·day)/RfD (mg/kg·day)

Example Carcinogen: benzene

$$Intake\ (mg/kg{\cdot}day) = \frac{0.003\ mg/L \times 2\ L/day \times 350\ days/yr \times 30\ yrs}{70\ kg \times 25{,}550\ days}$$

$$= 3.52E\text{-}05$$

Risk = 3.52E-05 mg/kg·day x 2.90E-02 $mg/kg{\cdot}day^{-1}$ = 1.02E-06

Example Noncarcinogen: naphthalene

$$Intake\ (mg/kg{\cdot}day) = \frac{0.1843\ mg/L \times 2\ L/day \times 350\ days/yr \times 30\ yrs}{70\ kg \times 10{,}950\ days}$$

$$= 5.05E\text{-}03$$

$$Risk = \frac{5.05E-03\ mg/kg{\cdot}day}{4.00E-02\ mg/kg{\cdot}day} = 0.126$$

EXAMPLE GROUNDWATER INGESTION CALCULATIONS (Worst Case Results)
OPERABLE UNIT NO. 12 (SITE 3)
CONTRACT TASK ORDER 0274

Purpose: Estimate intake/risk from ingestion of groundwater

$$Intake\ (mg/kg{\cdot}day) = \frac{C \times IR \times EF \times ED}{BW \times AT}$$

Where:

C	=	Contaminant concentration in groundwater (mg/L)
IR	=	Daily intake ingestion rate (L/day)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
BW	=	Body weight (kg)
AT_c	=	Averaging time carcinogen (days)
AT_{nc}	=	Averaging time noncarcinogen (days)

Risks:

Carcinogens = Intake (mg/kg·day) x CSF $(mg/kg{\cdot}day)^{-1}$
Noncarcinogens = Intake (mg/kg·day)/RfD (mg/kg·day)

Example Carcinogen: benzene

$$Intake\ (mg/kg{\cdot}day) = \frac{0.04\ mg/L \times 2\ L/day \times 350\ days/yr \times 30\ yrs}{70\ kg \times 25{,}550\ days}$$

= 4.70E-04

Risk = 4.70E-04 mg/kg·day x 2.90E-02 $mg/kg{\cdot}day^{-1}$ = 1.36E-05

Example Noncarcinogen: chromium

$$Intake\ (mg/kg{\cdot}day) = \frac{0.0316\ mg/L \times 2\ L/day \times 350\ days/yr \times 30\ yrs}{70\ kg \times 10{,}950\ days}$$

= 8.66E-04

$$Risk = \frac{8.66E{-}04\ mg/kg{\cdot}day}{5.00E{-}03\ mg/kg{\cdot}day} = 0.173$$

EXAMPLE DERMAL CONTACT WITH GROUNDWATER CALCULATIONS (Round 2 Only)
OPERABLE UNIT NO. 12 (SITE 3)
CONTRACT TASK ORDER 0274

Purpose: Estimate intake/risk from dermal contact with groundwater

$$Intake\ (mg/kg{\cdot}day) = \frac{C \times SA \times PC \times ET \times EF \times ED \times CF}{BW \times AT}$$

Where:

C	=	Contaminant concentration in groundwater (mg/L)
SA	=	Exposed skin surface available for contact (cm^2)
PC	=	Permeability constant (cm/hr)
ET	=	Exposure time (hr/day)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
CF	=	Conversion factor (1 L/1,000 cm^3)
BW	=	Body weight (kg)
AT_c	=	Averaging time carcinogen (days)
AT_{nc}	=	Averaging time noncarcinogen (days)

Risks:

Carcinogens = Intake (mg/kg·day) x CSF $(mg/kg{\cdot}day)^{-1}$
Noncarcinogens = Intake (mg/kg·day)/RfD (mg/kg·day)

Example Carcinogen: Benzene

$$Intake\ (mg/kg{\cdot}day) = \frac{0.003\ mg/L \times 23{,}000\ cm^2 \times 1.1E{-}01\ cm/hr \times 0.25\ hr/day \times 350\ days/yr \times 30\ yrs \times 1\ L/1{,}000\ cm^3}{70\ kg \times 25{,}550\ days}$$

$$= 1.11E\text{-}05$$

Risk = 1.11E-05 mg/kg·day x 2.90E-02 $mg/kg{\cdot}day^{-1}$ = 3.23E-07

Example Noncarcinogen: Naphthalene

$$Intake\ (mg/kg{\cdot}day) = \frac{0.1843\ mg/L \times 23{,}000\ cm^2/hr \times 6.90E{-}02\ cm/hr \times 0.25\ hr/day \times 350\ days/yr \times 30\ yrs \times 1\ L/1{,}000\ cm^3}{70\ kg \times 10{,}950\ days}$$

$$= 1.00E\text{-}03$$

$$Risk = \frac{1.00E{-}03\ mg/kg{\cdot}day}{4.00E{-}03\ mg/kg{\cdot}day} = 0.25$$

Re: Site 3 Future Residential Adult

GROUNDWATER DERMAL CONTACT EXPOSURE ASSESSMENT (ROUND 2 ONLY)
OPERABLE UNIT NO.12 (SITE 3)
REMEDIAL INVESTIGATION CTO-0274
MCB CAMP LEJEUNE, NORTH CAROLINA
FUTURE RESIDENTIAL ADULT

Dermal Contact from groundwater is calcuated as follows:

Intake (mg/kg-day) = CW * SA * PC * ET * EF * ED * CF/BW * ATc or ATnc * DY

Risk = Intake * CSF or /RfD

Where:	INPUTS
CW = contaminant concentration in water (mg/l)	
SA = adult skin surface available for contact (cm2)	23000
PC = contaminant specific dermal permability (cm/hr)	Specific
ET = adult exposure time (hours/day)	0.25
EF = adult exposure frequency (days/yr)	350
ED = adult exposure duration (years)	30
CF = volumetric conversion factor for water (1liter/1000 cm3)	0.001
BW = adult body weight (kg)	70
ATc = averaging time for carcinogen (yr)	70
ATnc = averaging time for noncarcinogen (yr)	30
DY = days per year (days)	365

Note: Inputs are site and scenario specific

GROUNDWATER DERMAL CONTACT EXPOSURE ASSESSMENT (ROUND 2 ONLY)
OPERABLE UNIT NO. 12 (SITE 3)
REMEDIAL INVESTIGATION CTO-0274
MCB CAMP LEJEUNE, NORTH CAROLINA
FUTURE RESIDENTIAL CHILD

Dermal Contact from groundwater is calcuated as follows:

Intake (mg/kg-day) = CW * SA * PC * ET * EF * ED * CF/BW * ATc or ATnc * DY

Risk = Intake * CSF or /RfD

Where:	INPUTS
CW = contaminant concentration in water (mg/l)	
SA = child skin surface available for contact (cm2)	10000
PC = contaminant specific dermal permability (cm/hr)	Specific
ET = child exposure time (hours/day)	0.25
EF = child exposure frequency (days/yr)	350
ED = child exposure duration (years)	6
CF = volumetric conversion factor for water (1liter/1000 cm3)	0.001
BW = child body weight (kg)	15
ATc = averaging time for carcinogen (yr)	70
ATnc = averaging time for noncarcinogen (yr)	6
DY = days per year (days)	365

COPC	Concentration Carcinogen (mg/l)	Surface Area (cm2) Child	Dermal Permeability (cm/hr)	Exposure Time (hours/day) Child	Exposure Frequency (days/yr) Child	Exposure Duration (years) Child	Volumetric Conversion (L/m3)	Body Weight (kg) Child	Averaging Carc Time (days)	Carc Dose (mg/kg-day) Child	Dermal Adjust. EXAMPLE DERMAL CONTACT WITH GROUNDWATER CALCULATIONS (Worst Case Results)
OPERABLE UNIT NO. 12 (SITE 3)
CONTRACT TASK ORDER 0274

Purpose: Estimate intake/risk from dermal contact with groundwater

$$Intake\ (mg/kg{\cdot}day) = \frac{C \times SA \times PC \times ET \times EF \times ED \times CF}{BW \times AT}$$

Where:

C	=	Contaminant concentration in groundwater (mg/L)
SA	=	Exposed skin surface available for contact (cm^2)
PC	=	Permeability constant (cm/hr)
ET	=	Exposure time (hr/day)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
CF	=	Conversion factor (1 L/1,000 cm^3)
BW	=	Body weight (kg)
AT_c	=	Averaging time carcinogen (days)
AT_{nc}	=	Averaging time noncarcinogen (days)

Risks:

Carcinogens = Intake (mg/kg·day) x CSF $(mg/kg{\cdot}day)^{-1}$
Noncarcinogens = Intake (mg/kg·day)/RfD (mg/kg·day)

Example Carcinogen: benzene

$$Intake\ (mg/kg{\cdot}day) = \frac{0.04\ mg/L \times 23{,}000\ cm^2 \times 1.10E{-}01\ cm/hr \times 0.25\ hr/day \times 350\ days/yr \times 30\ yrs \times 1\ L/1{,}000\ cm^3}{70\ kg \times 25{,}550\ days}$$

$$= 1.49E{-}04$$

Risk = 1.49E-04 mg/kg·day x 2.90E-02 $mg/kg{\cdot}day^{-1}$ = 4.31E-06

Example Noncarcinogen: chromium

$$ntake\ (mg/kg{\cdot}day) = \frac{0.0316\ mg/L \times 23{,}000\ cm^2/hr \times 1.00E{-}03\ cm/hr \times 0.25\ hr/day \times 350\ days/yr \times 30\ yrs \times 1\ L/1{,}000\ cm}{70\ kg \times 10{,}950\ days}$$

$$= 2.50E{-}06$$

$$Risk = \frac{2.50E{-}06\ mg/kg{\cdot}day}{5.00E{-}03\ mg/kg{\cdot}day} = 0.000498$$

EXAMPLE INHALATION OF VOLATILE ORGANICS CALCULATIONS (Round 2 Only)
OPERABLE UNIT NO. 12 (SITE 3)
CONTRACT TASK ORDER 0274

Purpose: Estimate intake/risk from the inhalation of volatile organics

$$Intake\ (mg/kg{\cdot}day) = \frac{Cs \times IR \times ET \times EF \times ED \times 1.0}{BW \times AT}$$

Where:	Cs	=	Shower air concentration (mg/m^3)
	IR	=	Inhalation rate (m^3/hr)
	ET	=	Exposure time (hrs/day)
	EF	=	Exposure frequency (days/year)
	ED	=	Exposure duration (years)
	BW	=	Body weight (kg)
	AT	=	Averaging time (days)

Risks:

Carcinogens = Intake (mg/kg·day) x CSF $(mg/kg{\cdot}day)^{-1}$
Noncarcinogens = Intake (mg/kg·day)/RfD (mg/kg·day)

Example Carcinogen: 1,1-dichloroethene

$$Intake\ (mg/kg{\cdot}day) = \frac{3.6E{-}05\ mg/m^3 \times 0.6\ m^3/hr \times 0.25\ hrs/d \times 350\ days/yr \times 30\ yrs}{70\ kg \times 25{,}550\ days}$$

$$= 3.17E{-}08$$

Risk = 3.17E-08 mg/kg·day x 1.75E-01 $mg/kg{\cdot}day^{-1}$ = 5.5E-09

Example Noncarcinogen: Benzene

$$Intake\ (mg/kg{\cdot}day) = \frac{3.0E{-}06\ mg/m^3 \times 0.6\ m^3/hr \times 0.25\ hrs/d \times 350\ days/yr \times 30\ yrs}{70\ kg \times 10{,}950\ days}$$

$$= 6.2E{-}09$$

$$Risk = \frac{6.2E{-}09\ mg/kg{\cdot}day}{1.71E{-}03\ mg/kg{\cdot}day} = .0000036$$

Re: Site 3 Future Residential Adult

INHALATION OF VOLATILE ORGANICS IN GROUNDWATER (ROUND 2 ONLY)
OPERABLE UNIT NO. 12 (SITE 3)
REMEDIAL INVESTIGATION CTO-0274
MCB CAMP LEJEUNE, NORTH CAROLINA
FUTURE RESIDENTIAL ADULTS AND CHILDREN

PURPOSE: TO ESTABLISH AIR CONCENTRATIONS OF VOLATILE ORGANIC CONSTITUENTS (VOCs) ASSOCIATED WITH SHOWERING AND THE SUBSEQUENT FUTURE HYPOTHETICAL INHALATION EXPOSURE OF ADULTS AND ADOLESCENTS.

PERTINANT EQUATIONS:

$$Cs = Cinf[1+(1/(kts))(exp(-kts)-1)]$$

where:

Cs = SHOWER AIR CONCENTRATION (mg/m^3)
Cinf = ASSYMPTOTIC CONCENTRATION IN AIR (mg/m^3)
ts = SHOWERING TIME (min)
k = RATE CONSTANT (min^-1)

$$Cinf = [(E)(Fw)(Ct/1000)]/Fa$$

where:

E = THE EFFICIENCY OF RELEASE - WATER TO AIR
Fw = THE FLOW RATE OF WATER IN THE SHOWER (L/min)
Ct = CONSTITUENT CONCENTRATION IN SHOWER WATER
Fa = FLOW RATE OF AIR IN THE SHOWER (m^3/min)

$$k = Fa/Vb$$

where:

Vb = THE VOLUME OF AN AVERAGE BATHROOM (m^3)

$$EI = (Etce)(Hi)/(Htce)$$

where:

EI = THE RELATIVE EFFICIENCY OF RELEASE OF CHEMICA
Etce = THE EFFICIENCY OF RELEASE OF TCE
Hi = THE HENRY's CONSTANT FOR CHEMICAL i (m^3 atm/
Htce = THE HENRY's CONSTANT FOR TCE (m^3 atm/mol)

APPENDIX O
FIELD DATA SHEETS

ECOLOGICAL EVALUATION
FIELD DATA SHEET - TERRESTRIAL

Project Name: Habitat Evaluation

Location: MCB Camp Lejeune, Jacksonville, NC

Date: 12/7/94

Sampling Location: Creosote Mixing Area

Data Collected By: JSS, CDC

Habitat Type: Mixed Deciduous/Pine Forest

Vegetation:

Trees:

Dominant Species:

1. Loblolly - Pinus taeda - dom. in some areas
2.
3.
4.
5.
6.
7.
8.
9.
10.

Secondary Species:

1. Tulip Poplar - Liriodendron Tulipifera
2. Black Cherry - Prunus serotina
3. Water Oak - Quercus nigra
4. Sassafras - Sassafras albidum
5. Willow Oak - Q. phellos
6. Sweetgum - Liquidambar Styraciflua
7. Southern red oak - Q. falcata
8. Holly - Ilex opaca
9. ~~Red~~ Sweetbay - Magnolia virginiana
10.

Saplings/Shrubs:

Dominant Species:

1. none dominant
2. _____
3. _____
4. _____
5. _____
6. _____
7. _____
8. _____
9. _____
10. _____

Secondary Species:

APPENDIX P
ENDANGERED SPECIES SURVEY

III. SUMMARY OF FINDINGS

A. SPECIES SIGNIFICANCE

Camp Lejeune Marine Corps Base contains an impressive spectrum of high quality habitats associated with the outer Coastal Plain of North Carolina. This quality is reflected in the exceptionally large number of rare animal and plant species documented during the inventory. A total of 15 animal species and 55 plant species recognized as rare at the Federal or State level are known to occur in Camp Lejeune. Among these are six Federally listed species:

FEDERALLY ENDANGERED
Peregrine Falcon (Falco peregrinus)
Rough-leaf Loosestrife (Lysimachia asperulifolia)
Red-cockaded Woodpecker (Picoides borealis)

FEDERALLY THREATENED
American Loggerhead Turtle (Caretta caretta)
Piping Plover (Charadrius melodus)
Green Turtle (Chelonia mydas)

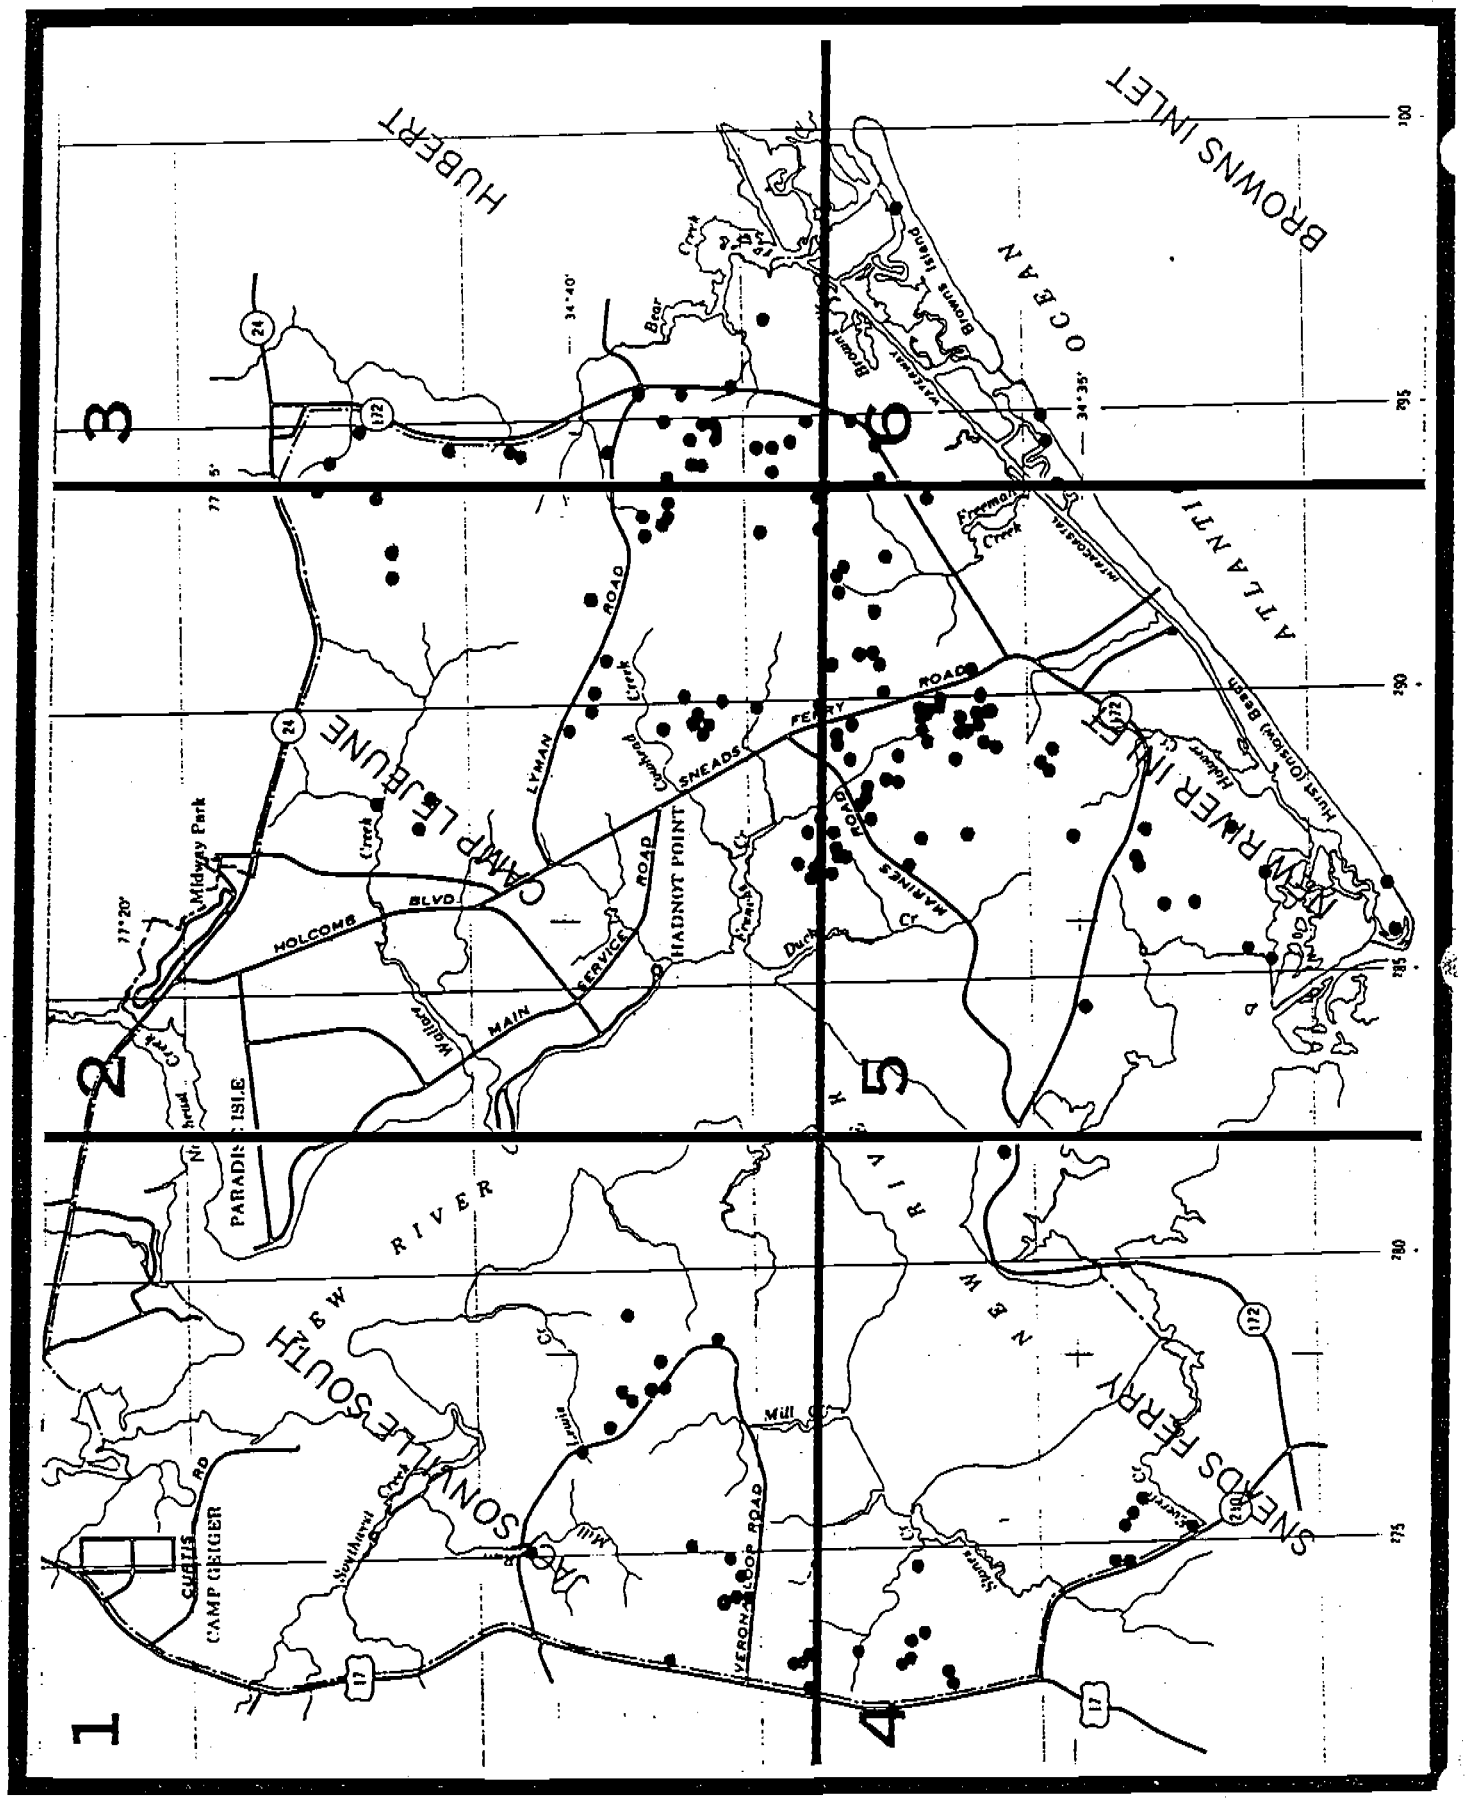
Another 15 species are Candidates for Federal listing:

ANIMAL CANDIDATES FOR FEDERAL LISTING
Bachman's Sparrow (Aimophila aestivalis)
Southern Hognose Snake (Heterodon simus)
Diamondback Terrapin (Malaclemys terrapin)
Carolina Gopher Frog (Rana capito capito)

PLANT CANDIDATES FOR FEDERAL LISTING
Seabeach Amaranth (Amaranthus pumilus)
Chapman's Sedge (Carex chapmanii)
Hirst's Witchgrass (Dichanthelium species 1)*
Pondspice (Litsea aestivalis)
Boykin's Lobelia (Lobelia boykinii)
Loose Watermilfoil (Myriophyllum laxum)
Savanna Cowbane (Oxypolis ternata)
Awned Meadow-beauty (Rhexia aristosa)
Carolina Goldenrod (Solidago pulchra)
Carolina Dropseed (Sporobolus species 1)*
Carolina Asphodel (Tofieldia glabra)

* Hirst's Witchgrass was formerly known by the scientific name of Panicum hirstii, and remains to be reclassified in the genus to which it belongs (Dichanthelium). Carolina Dropseed previously was erroneously included in Sporobolus teretifolius, and remains to be described as a new species.

Venus Flytrap (Dionaea muscipula) had been recommended for upgrading to the status of Federal Candidate at the time of this report.



Locations of all rare plant and animal species.

Camp Lejeune habitats contain significant percentages of the known global populations of the following plant species:

	Lejeune sites	Global %
Lejeune Goldenrod (Solidago species 1)	1	100
Awned Meadow-beauty (Rhexia aristosa)	53	64
Carolina Goldenrod (Solidago pulchra)	24	40
Hirst's Witchgrass (Dichanthelium species 1)	2	29
Chapman's Sedge (Carex chapmanii)	5	20
Venus Flytrap (Dionaea muscipula)	23	15
Carolina Asphodel (Tofieldia glabra)	13	13
Rough-leaf Loosestrife (Lysimachia asperulifolia)	3	5

The 55 Camp Lejeune sites for Bachman's Sparrow (Aimophila aestivalis) constitute the largest concentration of this Federal Candidate in North Carolina.

B. HABITAT SIGNIFICANCE

Camp Lejeune contains several areas with exemplary natural communities, often supporting many rare species. The most important of these have been identified as "Natural Areas." Fourteen Natural Areas have been inventoried and described (see Chapter IX.A). Two of them--Longleaf Pine Natural Area and Wallace Creek Swamp Natural Area--already have been registered with the N.C. Natural Heritage Program, and the other 12 areas are recommended for registry.

These Natural Areas contain one-to-several exemplary natural communities. A natural community is defined as "a distinct and reoccurring assemblage of populations of plants, animals, bacteria, and fungi naturally associated with each other and their physical environment" (Schafale and Weakley 1990). A discrete Pine Savanna, Small Depression Pond, or Salt Marsh are examples of the several natural community types found in Camp Lejeune.

Camp Lejeune contains some of the finest examples of these natural communities known in North Carolina, and a few of these community types are globally rare. The Calcareous Coastal Fringe Forest on the 100-acre midden at Corn Landing is the only known extant example of this community type. Camp Lejeune contains some of the best examples of the following globally rare natural community types: Cypress Savanna, Depression Meadow, and Small Depression Pond. The Maritime Evergreen Forest hammocks at and between Cedar Point and Shell Point are connected by shell tombolos, and appear to be a very rare geological formation.

There are several reasons why Camp Lejeune is a refuge for rare species and natural communities that were once in greater abundance on the outer Coastal Plain. Relatively small portions of the landscape were altered by agriculture prior to the camp's establishment, and silviculture similarly has been restricted.

The infrastructure of the base is mostly clustered. Much of the training activity is confined to roadbeds and training on foot, greatly reducing impacts to natural systems. Importantly, the base Environmental Management Department actively manages habitats to maintain natural communities through protection or replication of natural processes, such as by controlled burns. Camp Lejeune Marine Corps Base can take great pride in the fact that it has preserved and protected many threatened components of the natural landscape while achieving its training objectives.

C. TABLES OF SPECIAL-INTEREST NATURAL AREAS, EXEMPLARY NATURAL COMMUNITIES AND NATURAL AREAS.

Table 5. Identified special-interest natural areas at Camp Lejeune, including training areas, exemplary natural communities, and UTM coordinates.

Name	Training Area	Exemplary Natural Communities/ UTM Coordinates

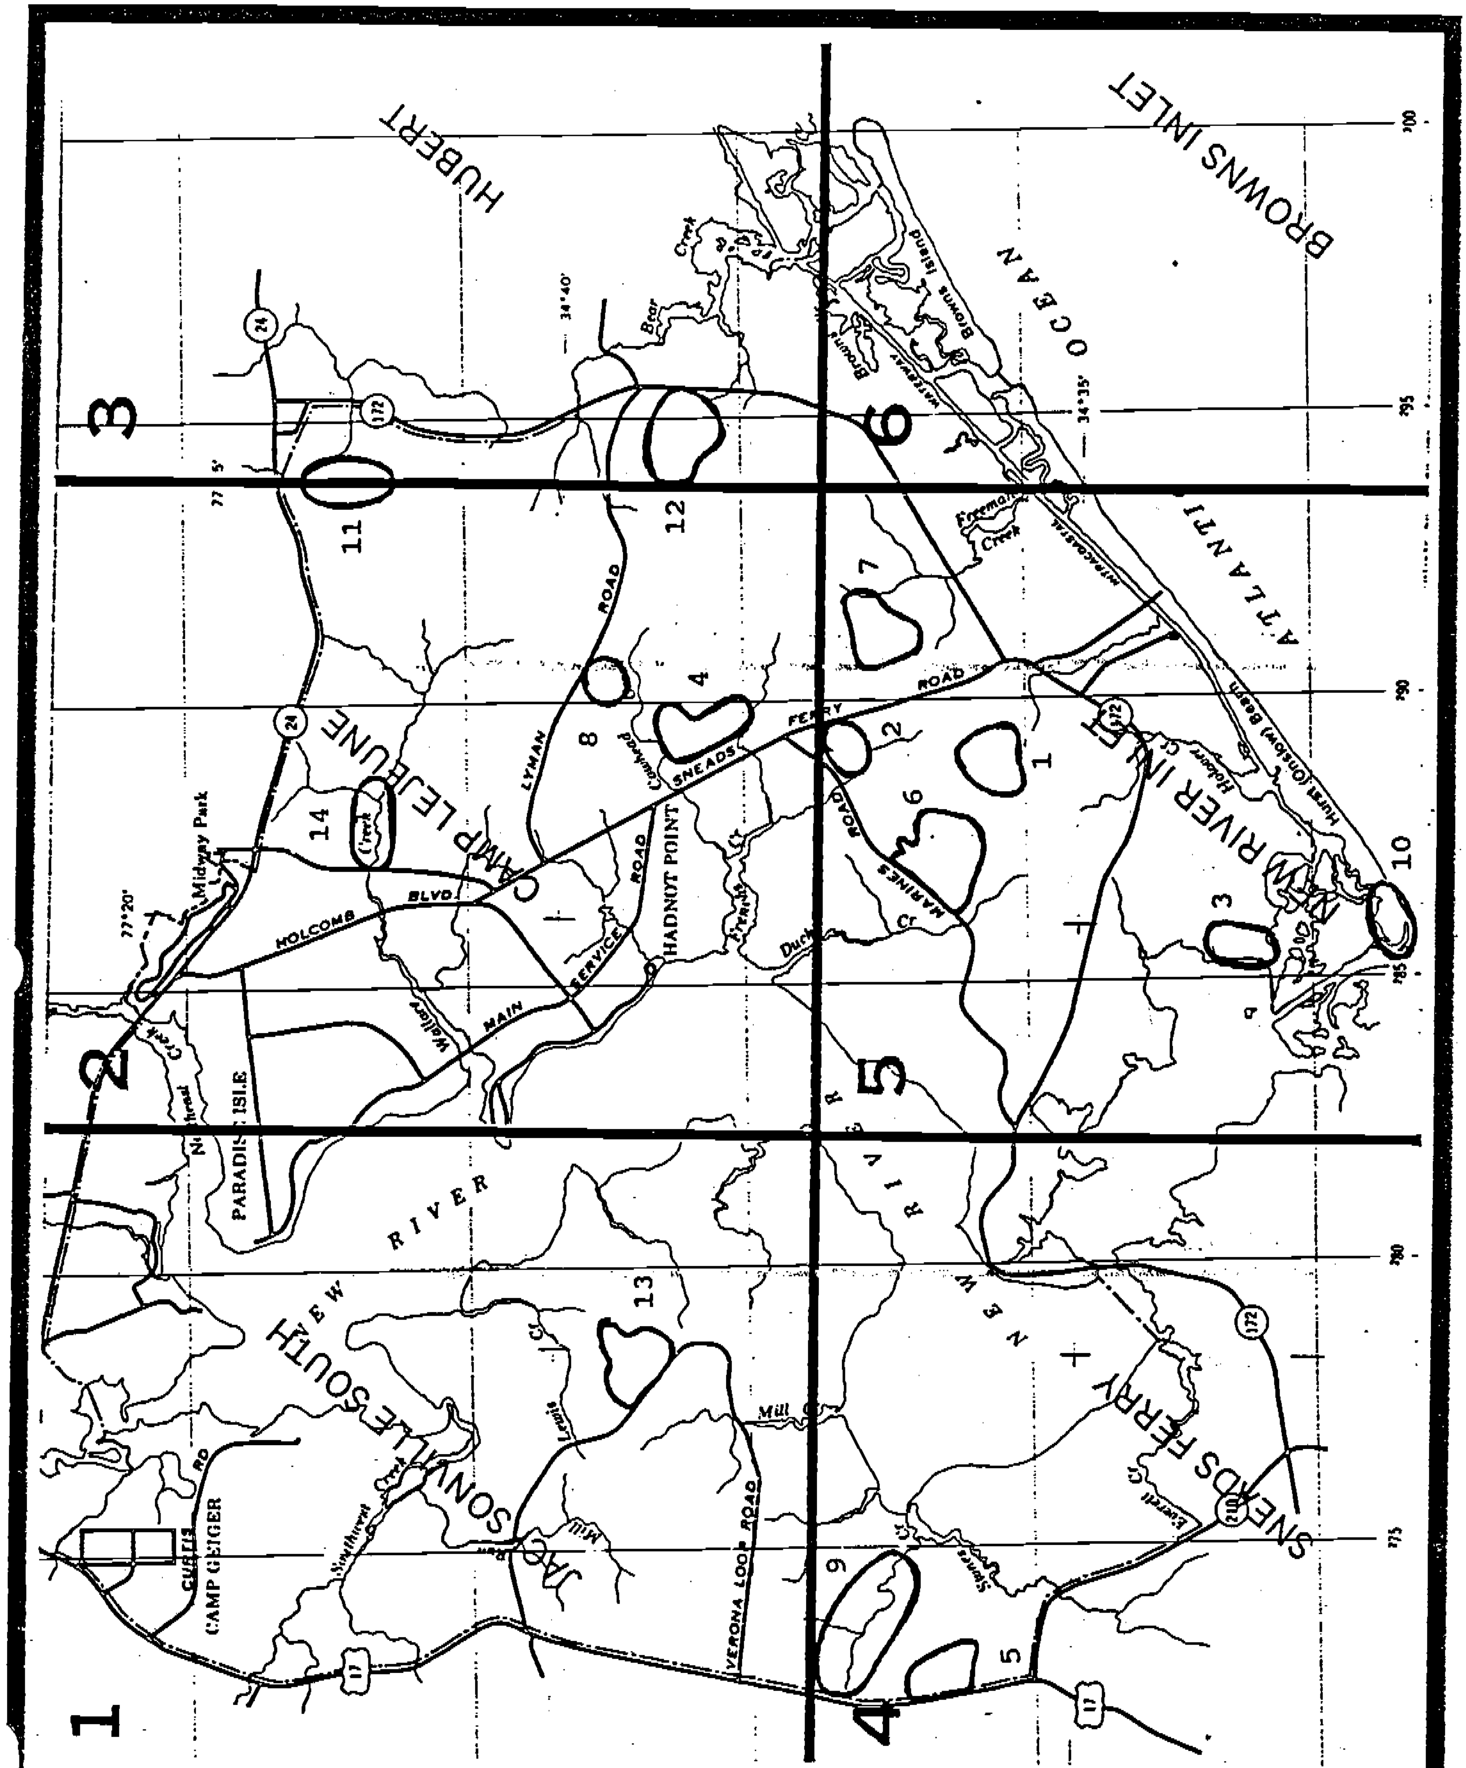
INDEX TO BASE MAP OF SPECIAL-INTEREST NATURAL AREAS

(1) Africa Pond Limesinks Natural Area
(2) Alligator Meadow Limesinks Natural Area
(3) Corn Landing Natural Area
(4) Cowhead Creek Limesinks Natural Area
(5) Dixon Pine Savanna Natural Area
(6) Longleaf Pine Natural Area
(7) Loosestrife Pocosin Natural Area
(8) Lyman Road Cypress Savanna Natural Area
(9) Millstone Creek Swamp Natural Area
(10) New River Inlet Natural Area
(11) Pocosin Road Flatwoods Natural Area
(12) Spring Branch Limesinks Natural Area
(13) Verona Loop Flatwoods Natural Area
(14) Wallace Creek Swamp Natural Area



Locations of all Special-Interest Natural Areas at Camp Lejeune.

D. TABLES OF RARE SPECIES

The tables in this section list all of the Federal and State listed rare animal and plant species documented in Camp Lejeune. The Federal and State rarity status codes and Global and State abundance ranks are given for each species in the tables. These status and rank codes are defined below.

DEFINITION OF STATUS AND RANK CODES

STATUS CODES (DESIGNATED RARITY)

U.S. Status. As designated by the U.S. Fish and Wildlife Service (USFWS).

E = Endangered. A species that is threatened with extinction throughout all or a significant portion of its range.

T = Threatened. A species that is likely to become endangered in the foreseeable future.

P = Proposed. Species currently proposed, as either Endangered or Threatened. Species formally proposed receive some legal protection.

C1 = Candidate 1. A species for which the USFWS has on file enough substantial information to list as Endangered or Threatened. Listing is "warranted but precluded by other pending proposals of higher priority." The USFWS is "directed to make prompt use of the emergency listing provisions if the well-being of any such species is at significant risk." (No Camp Lejeune species possessed this status at the time of this report.)

C2 = Candidate 2. A species for which there is some evidence of vulnerability, but for which there are not enough data to support listing as Endangered or Threatened at this time. Listing is "warranted but precluded by other pending proposals of higher priority." The USFWS is "directed to make prompt use of the emergency listing provisions if the well-being of any such species is at significant risk."

3A = Candidate 3A. A species for which the USFWS has persuasive evidence of extinction. (No Camp Lejeune species possessed this status at the time of this report.)

3B = Candidate 3B. A name that, on the basis of current taxonomic understanding, does not represent a distinct species. (No Camp Lejeune species possessed this status at the time of this report.)

3C = Candidate 3C. A species that has proven to be more abundant or widespread than previously believed and/or those that are not subject to any identifiable threat. They may be reevaluated for possible inclusion in categories 1 or 2. Five Camp Lejeune plant species possess this status: *Calamovilfa brevipilis*, *Dionaea muscipula*, *Muhlenbergia torreyana*, *Sageretia minutiflora*, and *Sarracenia rubra* ssp. *rubra*. *Dionaea muscipula* had been recommended for upgrading to Candidate 2 at the time of this report.

N.C. Status - Animals.

E = Endangered. Any native or once-native species of wild animal whose continued existence as a viable component of the State's fauna is determined by the Wildlife Resources Commission to be in jeopardy, or any species of wild animal determined to be an Endangered species pursuant to the U.S. Endangered Species Act.

T = Threatened. Any native or once-native species of wild animal which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range in North Carolina, or one that is designated as a Threatened species pursuant to the U.S. Endangered Species Act.

SC = Special Concern. Any species of wild animal native or once-native to North Carolina which is determined by the Wildlife Resources Commission to require monitoring but which may be taken under regulations adopted under the provisions of Article 25 of Chapter 113 of the General Statutes.

P = Proposed for State listing, but not yet official (PE = Proposed Endangered; PT = Proposed Threatened; PSC = Proposed Special Concern). (No Camp Lejeune species possessed this status at the time of this report.)

SR = Significantly Rare. Any other species which has not been determined as an Endangered, Threatened, or Special Concern species, but which exists in the State in small numbers and has been determined to need monitoring. This is a N.C. Natural Heritage Program designation.

V = Vulnerable. A relatively rare species with significant problems at present or anticipated in the near future. Used only for Marine and Estuarine Fishes. (No Camp Lejeune species possessed this status at the time of this report.)

UNK = Undetermined (unknown). A species for which insufficient data are available for precise assessment. This is a N.C. Natural Heritage Program designation. (No Camp Lejeune species possessed this status at the time of this report.)

* = Species is a game animal, and therefore (by law) cannot be listed for State protection as E, T, or SC. (No Camp Lejeune species possessed this status at the time of this report.)

= Species proposed for Endangered status, but not adopted by the Wildlife Resources Commission; species is protected from take. (No Camp Lejeune species possessed this status at the time of this report.)

@ = Species proposed for Special Concern status, but not adopted by the Wildlife Resources Commission; species is protected from take. (No Camp Lejeune species possessed this status at the time of this report.)

N.C. Status - Plants.

E = Endangered. Any species whose continued existence as a viable component of the State's flora is in jeopardy. Endangered species may not be removed from the wild except when a permit is obtained for research, propagation, or rescue which will enhance the survival of the species. Sale or distribution of wild-collected Endangered species is not permitted.

T = Threatened. Any species likely to become an endangered species within the foreseeable future. Regulations are the same as for Endangered species.

SC = Special Concern. Any species which requires population monitoring, but which may be collected and sold under specific regulations. Special Concern species which are not also listed as Endangered or Threatened may be collected from the wild and sold under specific regulations. Propagated material only of Special Concern species which are also listed as Endangered or Threatened may be traded or sold under specific regulations.

P = Proposed. Any species which has been formally proposed for listing as Endangered, Threatened, or Special Concern, but has not yet completed the legally mandated State listing process.

C = Candidate. Any species which, because of small numbers of populations, rare habitat, or distribution, may become threatened in the future; or a species suspected of being endangered or threatened, but for which sufficient information is not currently available to support such a status classification.

SR = Significantly Rare. Any other species which has been determined to be rare in North Carolina and in need of conservation and monitoring.

W = Watch List. Any other species believed to be rare in North Carolina, but with inadequate information to assess its rarity. For most species in this category, actual biological status has not been determined, either because taxonomic validity is unresolved, or because the species is frequently overlooked in the field and could be more common than present data indicate, or because it is a peripheral species common in an adjacent state.

RANK CODES (RANGEWIDE ABUNDANCE)

Global Rank. This is based on a species' abundance rangewide, and is the best available scientific assessment of a species' rarity throughout its range.

G1 = Critically imperiled globally because of extreme rarity (five or fewer occurrences or very few remaining individuals) or because of other factors making it especially vulnerable to extinction.

G2 = Imperiled globally because of rarity (six to 20 occurrences or few remaining individuals) or because of other factors making it very vulnerable to extinction.

G3 = Either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range (e.g., a single physiographic region) or because of other factors making it vulnerable to extinction. Occurrences range from 21 to 100.

G4 = Apparently secure globally, though it may be quite rare in parts of its range, especially at the periphery.

G5 = Demonstrably secure globally, though it may be quite rare in parts of its range, especially at the periphery.

G? = Unranked, or rank uncertain.

Q = Following a "G" rank, this indicates questionable taxonomic status.

T = Following a "G" rank, this indicates the rank of a subspecies or variety. For example, "G4T1" would apply to a subspecies or variety of a species with an overall rank of G4, but with the subspecies or variety warranting a rank of G1.

A ranking involving two "G" numbers indicates a greater uncertainty or range of ranking. For instance, a "G2G3" rank indicates that the species may be a G2 or a G3, but that existing data do not allow that determination to be made.

North Carolina Rank. This is based on a species' abundance throughout North Carolina, independently of the global rank (however, a State rank can never show a greater abundance than the global rank).

S1 = Critically imperiled in North Carolina because of extreme rarity (five or fewer occurrences or very few remaining individuals) or because of other factors making it especially vulnerable to extirpation from North Carolina.

S2 = Imperiled in North Carolina because of rarity (six to 20 occurrences or few remaining individuals) or because of other factors making it very vulnerable to extirpation in North Carolina.

S3 = Rare or uncommon in North Carolina (on the order of 21 to 100 occurrences).

S4 = Apparently secure in North Carolina, with many occurrences.

S5 = Demonstrably secure in North Carolina and essentially ineradicable under present conditions.

SU = Possibly in peril in North Carolina but status uncertain; need more information.

S? = Same as "G?".

A ranking involving two "S" numbers indicates a greater uncertainty or range of ranking. For instance, an "S2S3" rank indicates that the species may be an S2 or an S3, but that existing data do not allow that determination to be made.

ADDENDA

Rarity status codes (Endangered, Significantly Rare, etc.) are frequently revised as more information about the populations of individual species becomes known. This report uses the status codes that were in effect as of December 31, 1991. The following list contains status code changes--many resulting from this inventory--that have been made between December 31, 1991, and December 31, 1993.

codes
E - Endangered
T - Threatened
C2 - Candidate, level 2 (US)
3C - Candidate 3C (US) (taxon more abundant than previously known)
C - Candidate (NC)
SR - Significantly Rare
WL - Watch List
P - Proposed (e.g., PT = Proposed Threatened)

	Status 12-31-91		Status 12-31-93	
Species	US	NC	US	NC

Xyris baldwiniana	-	WL	-	-

Cyperus dentatus. Specimens documented as C. dentatus at sites ME-2 and MF-2 subsequently have been determined to be C. lecontei (NC Significantly Rare).

Linum floridanum var. chrysocarpum. Specimens documented as this taxon at site LB-1 subsequently have been determined to be var. floridanum (no US or NC rare status).

Solidago species 1. This goldenrod appears to be new to science, and was discovered during the course of this survey. It is currently known only from Camp Lejeune, site HD-4.

The latest editions of the rare animal and plant lists published by the N.C. Natural Heritage Program should be consulted when using this report.

Table 9. Exemplary natural communities and endangered and rare animals and plants at Camp Lejeune by location; includes federal and state species status and UTM coordinates.

A = Animals; P = Plants

If UTM coordinates are not given for a particular community or species (excepting Picoides borealis), they are the same as the next set of coordinates above. In the case of P. borealis, it is listed at a site if the site occurs in or immediately adjacent to an RCW colony, but no coordinates are assigned to P. borealis itself. This list and its UTM coordinates should not be used as a basis for determining distribution of P. borealis in Camp Lejeune, as it is only a partial representation.

DERIVATION OF TERRESTRIAL REFERENCE VALUES
OPERABLE UNIT NO 12
SITE 3 - OLD CREOSATE PLANT
REMEDIAL INVESTIGATION, CTO-0274
MCB, CAMP LEJEUNE, NORTH CAROLINA

The following section discusses the procedures used to develop the terrestrial reference values (TRVs) used in the terrestrial portion of the ERA.

Most of the whitetailed deer, bobwhite quail, and cottontail rabbit TRVs for inorganic chemicals were derived from mineral tolerance values (MTLs) contained in the Mineral Tolerance of Domestic Animals (NAS, 1980). This book defines an MTL as "that dietary level that, when fed for a limited period, will not impair animal performance and should not produce unsafe residues in human food derived from the animal." (NAS, 1980) The values in this book were reported as mg mineral/kg feed. Therefore, these values were first converted to mg mineral/kg body weight-day using the following equation (Opresko et.al., 1993):

TRV = MTL * CR
where:
TRV = Terrestrial Reference Value (mg mineral/kg body weight-day)
MTL = Mineral Tolerance Value (mg mineral/kg food)
CR = consumption rate (kg food/kg body weight-day)

For the whitetailed deer TRVs derived from the cattle MTLs, a consumption rate of 0.05 kg food/kg body weight-day was used for the cow (O'Dell, 1971). Because the cattle MTL was developed primarily with cow studies that were conducted for less than 6 months, the new TRV was multiplied by 0.1 to account for subchronic to chronic uncertainty. The TRV for a cow then was adjusted to a TRV for a deer to account for differences in the body size using the following equation (Opresko et.al., 1993):

TRV (deer) = [TRV (cow)]*[bw (cow)/bw (deer)]^1/3
Where:
TRV (deer) = Deer Terrestrial Reference Value (mg mineral/kg body weight-day)
TRV (cow) = Cow Terrestrial Reference Value (mg mineral/kg body weight-day)
bw (cow) = body weight of a cow (100 kg)
bw (deer) = body weight of a deer (45.4 kg)

MCB, CAMP LEJEUNE, NORTH CAROLINA

For the bobwhite quail TRVs derived from the poultry MTLs, a consumption rate of 0.41 kg food/kg body weight was calculated based on an average poultry weighing 0.5 kg, and the following allometric model (Nagy, 1987):

CR (birds) = 0.648 (bw)^0.651

Where:

CR (birds) = consumption rate for birds (kg food/kg body weight-day)

bw = body weight for an average bird (0.5 kg)

The TRV for poultry then was adjusted to a TRV for a bobwhite quail to account for differences in the body size using the same equation that was used to adjust the cow to the deer. The body weight used for the bobwhite quail was 0.174 kg.

For the cottontail rabbit TRVs derived from the rabbit MTLs, a consumption rate of 0.081 was calculated using the following equation:

CR (rabbit) = FR/bw

Where:

CR (rabbit) = consumption rate for rabbits (kg food/kg body weight-day)

FR = feeding rate of a cottontail rabbit (0.237 kg/day)

bw = body weight of a cottontail rabbit (1.229 kg)

The TRV (rabbit) was not adjusted for body size since a rabbit was used in the TRV calculation.

The following procedures were used for deriving TRV for the whitetailed deer, bobwhite quail, and cottontail rabbit when MTLs were not available, and for species that did not have MTLs. Their TRVs were determined using No Observed Adverse Effects Levels (NOAELs) or Lowest Observed Effects Levels (LOAELs). When available, the NOAEL or LOAEL from the Integrated Risk Information System (IRIS) was used in the TRV development. However, if a toxicity value was not available from IRIS, then one was obtained from various literature sources including Agency for Toxic Substances Registry Toxicological Profiles, Toxicological Benchmarks for Wildlife (Opresko *et.al.*, 1994) and published articles. Chemicals that only had diet concentration (as opposed to NOAELS) were converted to TRVs using the above equation and the appropriate consumption rates and body weights. The attached table contains the respective body weights used in the TRV adjustments.

As is presented in the attached table, toxicity data from many species were used to develop the TRVs. The attached table presents which animal was used to develop a particular TRV in parentheses. When possible, the chronic reproductive or developmental NOAEL value was used in the development of the TRV.

However, in some instances, only a subchronic NOAEL or a chronic or sub-chronic LOAEL for some chemicals were found in the literature. If a LOAEL was used, the number was divided by 10 as an uncertainty factor. If a subchronic value was used it also was divided by 10 as an uncertainty factor. Finally, toxicity values were not found for all the chemicals. Where possible, the toxicity or a similar chemical was used for these chemicals (i.e., using endrin for endrin aldehyde). The attached table identifies, in parentheses, which chemicals were used as surrogates.
